# SensorScope: An Environmental Monitoring System

## Today

Expensive, complex installation, limited storage, no real-time feedback. . .

## Tomorrow

Low cost, solar powered, flexible, real-time, multidimensional data. . .

# Hardware & Networking Architectures

## Hardware:

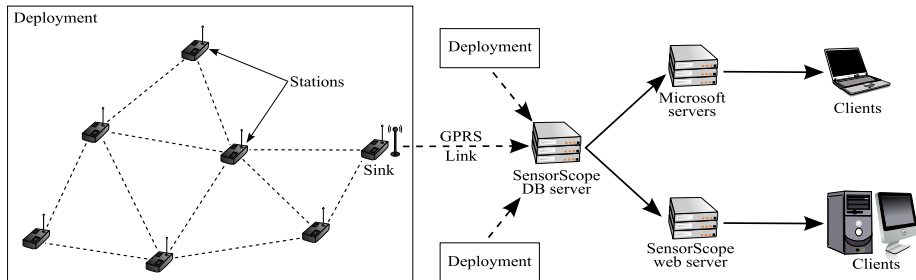

- ▶ TinyNode sensor mote:
  - ▶ MSP430 (1 MHz, 10 KB RAM, 48 KB ROM).
  - ▶ Xemics 1205 radio (868 MHz, 76 Kbps).
- ▶ Solar panel (1W)
- ▶ Two batteries (150 mAh NiMH + 2 Ah Li-Ion).
- ▶ Seven sensors, nine measures.

## Networking (TinyOS 2.x):

- ▶ Overhearing-based neighborhood discovery.
- ▶ Opportunistic gradient routing.
- ▶ Global synchronization.
- ▶ Synchronous duty-cycling.
- ▶ Open source.

# Global Architecture

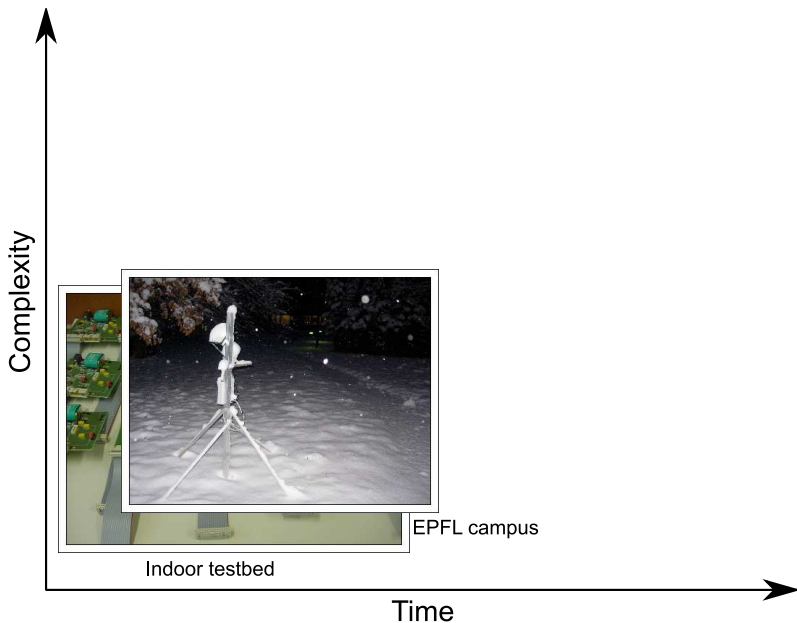

- ▶ Sink is equipped with Ethernet, WiFi, or GPRS connections.
- ▶ Allows for multiple simultaneous deployments.
- ▶ Data is (currently) publicly available on various servers.

# Consider Local Conditions

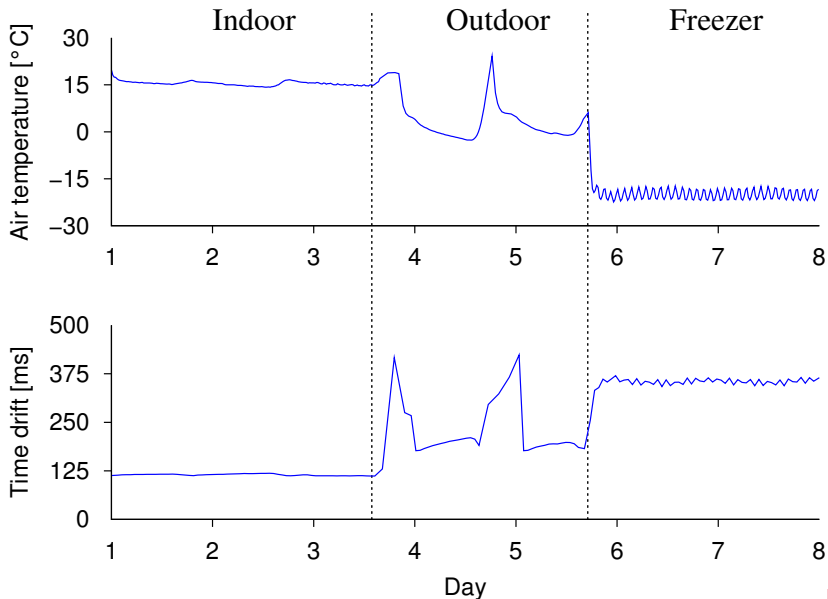

Weather conditions, especially the temperature and humidity, greatly affect the hardware.

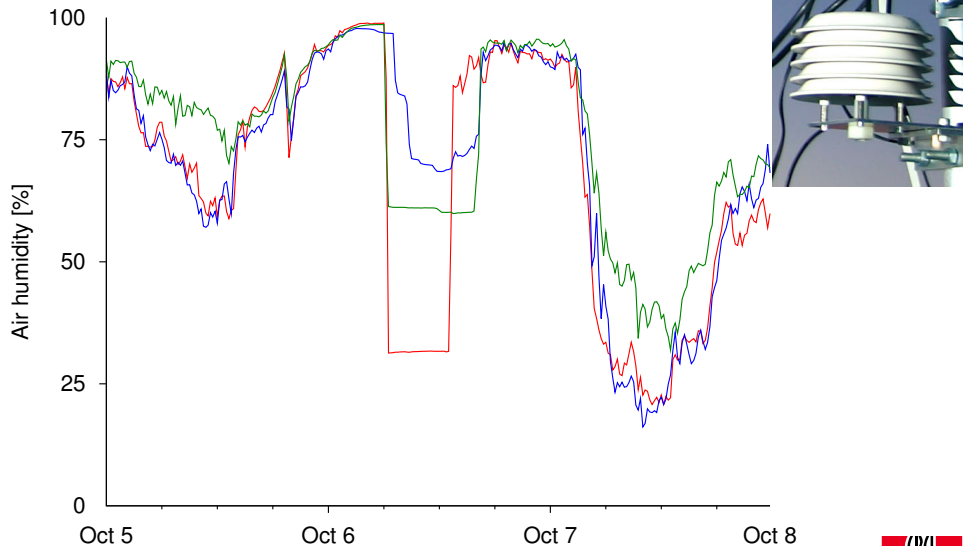

Test your equipment under similar conditions

- ▶ Packaging is crucial:
  - ▶ Outdoor sensors are susceptible to corrosion.
  - ▶ *Ingress Protection* (IP) 67 is needed for full protection.
- ▶ Li-Ion batteries can explode, when charged at sub-freezing temperatures!
- ▶ Crystal oscillators are highly impacted by the temperature.

# Impact of Air Temperature on Crystal Oscillators

# Humidity Measurements: Sensirion SHT75 (Génépi)

# Corrosion Kills

Back from deployment. . .

# Corrosion Kills

Back from deployment. . .

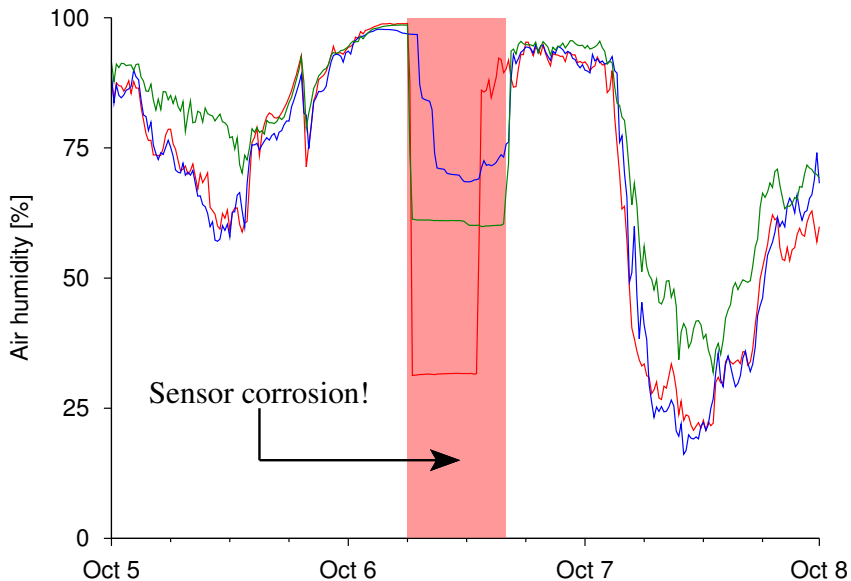

- ▶ Corrosion causes malfunction of sensors.
- ▶ Corrosion causes nodes reboot.

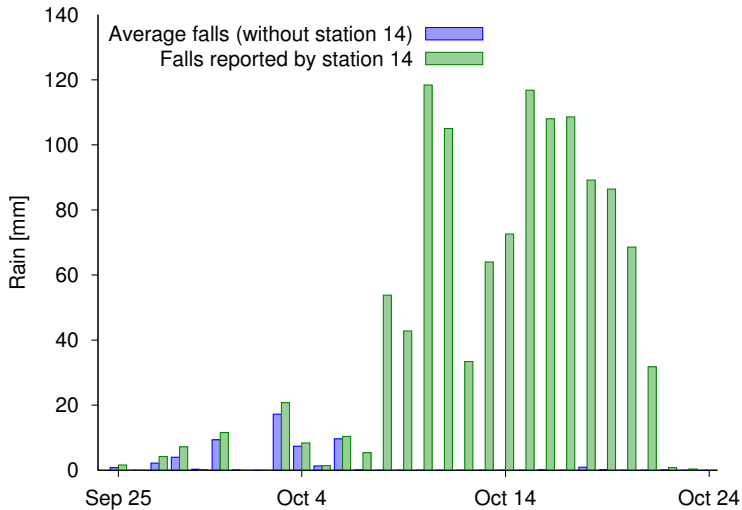

**Broken sensors can invalidate an otherwise successful deployment!**

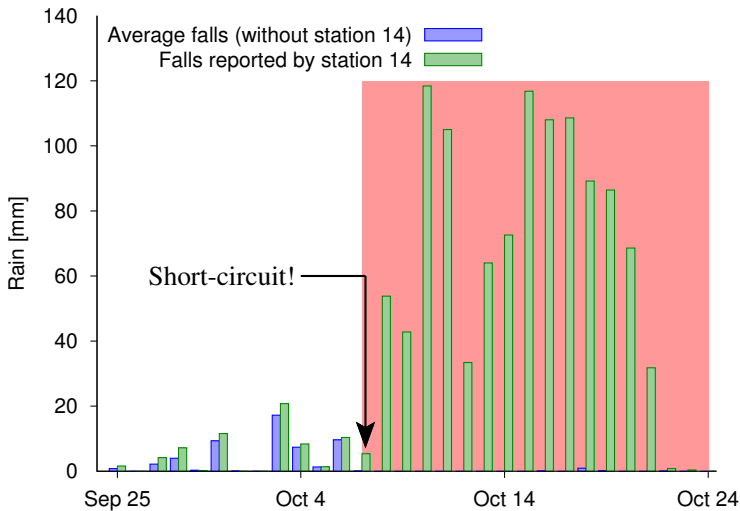

# Corrosion Kills — Sensirion SHT75 (Génépi)

# Corrosion Kills — Rain Meter (Grand Saint Bernard)

# Corrosion Kills — Rain Meter (Grand Saint Bernard)

Advice: *Packaging is of prime importance.*

# The Génépi Deployment

# Remote & Local Control

- ▶ We can control the sink with GSM text messages.
- ▶ We can monitor stations in the field.

# Don't Be a Black Box

Programming for embedded devices is very specific!

- ▶ Debugging with LEDs is exhausting. . .
- ▶ . . . And LEDs consume a lot of energy (*i.e.*, around 3 mA each).
- ▶ Embedded software is often subject to hardware failures.
- ▶ You must know what happens *inside* the network.

# Don't Be a Black Box

Programming for embedded devices is very specific!

- ▶ Debugging with LEDs is exhausting. . .
- ▶ . . . And LEDs consume a lot of energy (*i.e.*, around 3 mA each).
- ▶ Embedded software is often subject to hardware failures.
- ▶ You must know what happens *inside* the network.

In SensorScope, we use specific *status packets*:

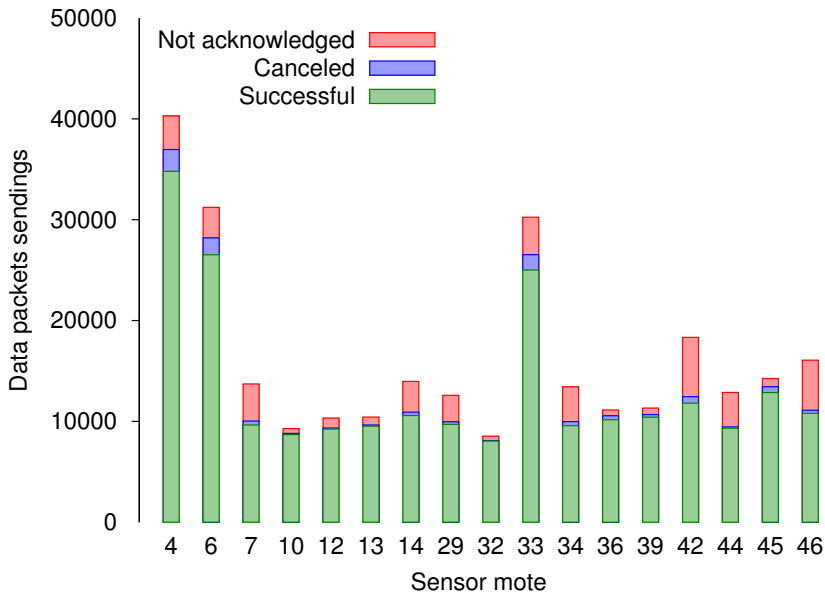

- ▶ *Energy* — Level of batteries, incoming solar power. . .
- ▶ *Network* — Most recent activity of the transport layer.
- ▶ *Neighborhood* — Neighborhood table and link qualities.

# Did You Say Outliers? (ClimatScope)

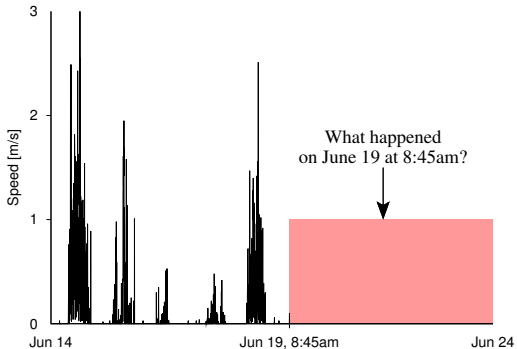

# Did You Say Outliers? (ClimatScope)

# Did You Say Outliers? (ClimatScope)

This is what happened. . .

# Seeing is Believing

Are you sure to interpret data correctly?

- ▶ High humidity level or fog?
- ▶ Rain or snow?
- ▶ Clouds or a leaf on the sensor?

Vidicam: 640x480 images every 30'.  
First deployment, Génési.

Unsolved problems:

- ▶ Energy management (2 months)
- ▶ Bandwidth (dedicated GPRS connection)

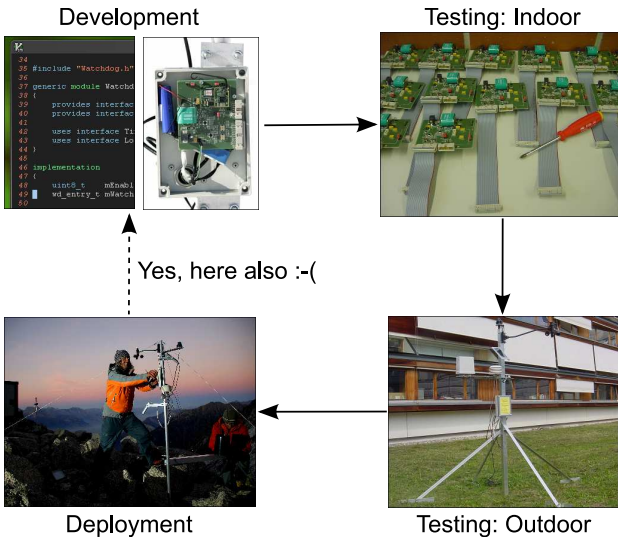

*Autonomous camera on the Génési.*

# Choose Your Partner

The permafrost creates a micro-climate on top of the Génépi mountain.
