Practically Competitive

Introduction	Introduction ○●	Previous Work	Our Results	Conclusion
Motivation				

Community Interest

- Cryptography Primitives
- Credential Revocation (Freshness of a Token)
- Anonymous Credentials (Identity and Authentication Proofs)

Concrete Examples

- Strict age anonymity (e.g. under 26, but older than 18).
- e-voting protocols, e-auctions, etc.

(日)

Zero-Knowledge Proofs

- Full security of cryptographic protocols is often achieved by having a zero-knowledge proof (of knowledge).
- Zero-knowledge: does not leak any extra information
- Proof: the actions of any party are consistent with his committed input *Com*(*x*)
- We actually are interested in Σ-protocols (see the paper).

Previous Work	Introduction	Previous Work o●ooooooo	Our Results	Conclusion
Background				

Homomorphic Commitments

- To construct *efficient* ZK proofs, one needs to assume that *Com* satisfies nice algebraic properties.
- Homomorphic commitment: $Com(x) \cdot Com(x') = Com(x + x')$.
- Then $Com(x)^a = \prod_a Com(x) = Com(ax).$
- From this trivially,

$$\prod_{i} Com(x_i)^{a_i} = Com\left(\sum_{i} a_i x_i\right) \text{ for any integers } a_i.$$

Additive Combinatorics

- Define $A + B := \{a + b : a \in A \land b \in B\}$ and $b * A := \{ba : a \in A\}$.
- A + B is a sumset, b * A is b-dilate of A.
- Additive combinatorics is the subject that studies the properties of sumsets.

(日)

Zero-Knowledge Proofs and Additive Combinatorics

• To prove that $C = Com(x) \land x \in \Phi$:

- Set $C_i = Com(x_i)$ for some x_i .
- ZK-prove that C_i = Com(x_i) ∧ x_i ∈ Φ_i for all i, where Φ = ∑ b_i * Φ_i.
- Compute $C = Com(x) = \prod Com(x_i)^{b_i}$.
- Requires:
 - Efficient sumset-presentation $\Phi = \sum_{i=0}^{\ell-1} b_i * \Phi_i$.
 - $\Rightarrow \ell \ll n$ with *n* small.
 - Efficient ZK-proofs that $C_i = Com(x_i) \land x_i \in \Phi_i$.
 - \Rightarrow small structured sets Φ_i .

Properties

- Large Complexity: O(k)
- 2x loss of efficiency for arbitrary upperbound: $\Phi = [0, H]$.

Lipmaa, Asokan, Niemi, 2002

• Decompose [0, *H*] as following:

 $[0, H] = \sum_{i=0}^{\log_2 H-1} G_i * [0, 1]$ with $G_i := \lfloor (H+2^i)/2^{i+1} \rfloor$.

- Twice more efficient than folklore proof for arbitrary H.
- Easy to prove that $x_i \in [0, 1]$.
- Communication complexity: $\Theta(\log H)$.
- Did not use the language of additive combinatorics.

イロト 不得 トイヨト イヨト 二日

Previous Work	Introduction	Previous Work	Our Results 00000	Conclusion
CCS'08				

Camenisch, Chaabouni, Shelat 2008

- Write $[0, u^{\ell} 1] = \sum u^{i} * [0, u 1].$
- Efficient ZK proof that C_i = Com(x_i) ∧ x_i ∈ [0, u − 1] done by letting the verifier sign the values 0, ..., u − 1, and the prover to prove that he knows signatures on all values x_i.
- Uses specific signature scheme based on bilinear pairings.
- By selecting optimal u, the communication complexity is $\Theta(\log H / \log \log H)$.
- Missing restriction for the OR-composition.
- If $H \neq u^{\ell} 1$, twice less efficient.

イロト 不得 トイヨト イヨト 三日

Problem that we solved

- Generalize LAN'02 to the case u > 2.
 - LAN'02: $[0, H] = \sum_{i=0}^{\log_2 H^{-1}} G_i * [0, 1]$ with $G_i := \lfloor (H + 2^i)/2^{i+1} \rfloor$.
 - CCS'08: $[0, u^{\ell} 1] = \sum u^{i} * [0, u 1].$
- Write $[0, H] = \sum_{i=0}^{\ell-1} G_i * [0, u-1] + [0, H'].$
 - $\ell \leq \log_u(H+1)$ and H' < u-1.
 - if (u-1) | H then H' = 0.

• We provide a semi-closed form to compute G_i.

Our Results	Introduction	Previous Work	Our Results	Conclusion
Intuition				

Basic Idea

- First write: $[0, H] = [0, H_0] = G_0 * [0, u 1] + [0, H_1].$
- Optimal G_0 is: $G_0 = \lfloor (H_0 + 1)/u \rfloor$.
- Hence $H_1 = H_0 (u 1)G_0$.
- If $H_1 \ge u 1$, then recursively set

$$G_i = \lfloor (H_i + 1)/u \rfloor,$$

$$H_{i+1}=H_i-(u-1)G_i.$$

- This process stops within $\ell \leq \log_u(H+1)$ steps.
- Hence $H' = H_{\ell} = H (u-1) \cdot \sum_{i=0}^{\ell-1} G_i = H (u-1) \cdot \lfloor H/(u-1) \rfloor$.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

Our Results	Introduction	Previous Work	Our Results	Conclusion
Theorems				

New Range Proof

We can write $[0, H] = \sum_{i=0}^{\ell-1} G_i * [0, u-1] + [0, H']$, with $\ell \leq \log_u(H+1)$, G_i given by recursive formulas, and $H' = H - \lfloor H/(u-1) \rfloor \cdot (u-1)$.

Optimal case reached when $u \approx \log_2 H / \log_2 \log_2 H$.

Additive Combinatorics and Discrete Logarithm Based Range Protocols Rafik Chaabouni, Helger Lipmaa, abhi shelat

ACISP 2010 16/20

Our Results	Introduction	Previous Work	Our Results ○○○●○	Conclusion
Theorems				

Semi-Closed Form for G_i

Let
$$H = \sum h_i u^i$$
. Then $G_i = \left\lfloor \frac{H}{u^{i+1}} \right\rfloor + \left\lfloor \frac{h_i + 1 + \left(\sum_{j=0}^{i-1} h_j \mod (u-1)\right)}{u} \right\rfloor$.

See the paper for a proof by induction (requires some case analysis).

LAN'02 result follows with u = 2.

Additive Combinatorics and Discrete Logarithm Based Range Protocols Rafik Chaabouni, Helger Lipmaa, abhi shelat

More Details

- Recall that if (u-1) | H then H' = 0.
- Instead of $x \in [0, H]$, we prove that $(u-1)x \in [0, (u-1)H]$.

Introduction

• Range proof twice more efficient than CCS'08 for general H.

Conclusion	Introduction	Previous Work	Our Results	Conclusion

Conclusion

- New range proof, twice more efficient than state of the art.
- Errors in CCS'08 corrected.
- Still room for further work (journal paper in progress).
