- ▶ Pick the  $x_m$  with the maximum EMI
- ▶ Complexity is exponential for random codebook
- ▶ Complexity is exponential also for structured codebook (Say a tree code)

A linear decoder induced by a single metric  $d$  is a rule given by

$$D_n(y) = \arg \max_m d^n(x_m, y)$$

where

$$d^n(x_m, y) = \frac{1}{n} \sum_{i=1}^n d(x_m(i), y(i)) = \mathbb{E}_{\hat{P}(x_m, y)}[d]$$

# Linear Decoder

A linear decoder induced by a single metric  $d$  is a rule given by

$$D_n(y) = \arg \max_m d^n(x_m, y)$$

where

$$d^n(x_m, y) = \frac{1}{n} \sum_{i=1}^n d(x_m(i), y(i)) = \mathbb{E}_{\hat{P}(x_m, y)}[d]$$

- ▶  $d^n$  has an additive structure

A linear decoder induced by a single metric  $d$  is a rule given by

$$D_n(y) = \arg \max_m d^n(x_m, y)$$

where

$$d^n(x_m, y) = \frac{1}{n} \sum_{i=1}^n d(x_m(i), y(i)) = \mathbb{E}_{\hat{P}(x_m, y)}[d]$$

- ▶  $d^n$  has an additive structure
- ▶  $d^{ML}(u, v) = \log W(v|u)$  is a linear decoder for DMC

# Linear Decoder

A linear decoder induced by a single metric  $d$  is a rule given by

$$D_n(y) = \arg \max_m d^n(x_m, y)$$

where

$$d^n(x_m, y) = \frac{1}{n} \sum_{i=1}^n d(x_m(i), y(i)) = \mathbb{E}_{\hat{P}(x_m, y)}[d]$$

- ▶  $d^{ML}(u, v) = \log W(v|u)$  is a linear decoder for DMC
- ▶ Why do we care about linear decoders?

# Compound Binary Memoryless channels

A tale of two games!

# Compound Binary Memoryless channels

A tale of two games! Game 1: Find universal input distribution  $P$

# Compound Binary Memoryless channels

A tale of two games! Game 1: Find universal input distribution  $P$

$$P_{opt} = \arg \max_P \inf_{W \in \mathcal{S}} \frac{I(P, W)}{C(W)}. \quad (1)$$

# Compound Binary Memoryless channels

A tale of two games! Game 1: Find universal input distribution  $P$

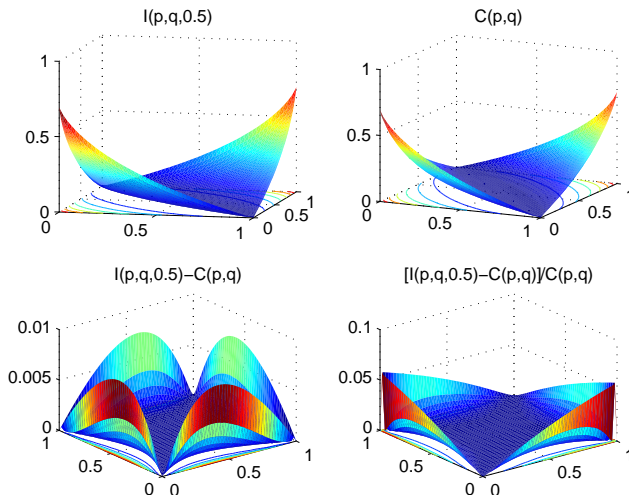

$$P_{opt} = \arg \max_P \inf_{W \in \mathcal{S}} \frac{I(P, W)}{C(W)}. \quad (1)$$

Game 2: Find linear universal decoder

# Uniform distribution does well

- ▶ Gets over 94.20% of the capacity!

# Worst case binary channel

[Majani 1991], [Shulman, Feder 2004]

- ▶ Z channel when  $p \rightarrow 1$
- ▶ Most of the channels does get over 98% (Simulation)

# Uniform priors

The Z channel capacity is

$$\begin{aligned} C &= \max_u I(X; Y) \\ &= \max_u h(up) - uh(p) \end{aligned}$$

Solving  $\frac{\partial}{\partial u} [h(up) - uh(p)] = 0$ , we get the capacity achieving input prior  $u^*$  and it is,

$$u^* = \frac{p^{\frac{p}{1-p}}}{1 + (1-p)p^{\frac{p}{1-p}}}$$

The worst possible Z channel is in the limit  $p \rightarrow 1$ .

$$\begin{aligned} \lim_{p \rightarrow 1} u(p) &= \lim_{p \rightarrow 1} \frac{p^{\frac{p}{1-p}}}{1 + (1-p)p^{\frac{p}{1-p}}} \\ &= \frac{1}{e} \end{aligned}$$

Then,

$$I(Z; 1)$$

# Uniform prior in general

- ▶ Input alphabet size  $\mathcal{A}$
- ▶ Uniform gets to  $\alpha = \frac{e}{\mathcal{A} \log_2(e)}$  times the capacity

# Mutual Information

$$\begin{aligned} I(P_X, W) &\triangleq I(X; Y) \\ &= H(Y) - H(Y|X) \\ &= \sum_{y \in \mathcal{Y}} \sum_{x \in \mathcal{X}} P_{XY}(x, y) \log \frac{P_{XY}(x, y)}{P_X(x)P_Y(y)} \\ &= \sum_{x \in \mathcal{X}, y \in \mathcal{Y}} P_{XY}(x, y) \log \frac{P_{XY}(x, y)}{P_X(x)P_Y(y)} \\ &= D(P_{XY}(x, y) \| P_X(x)P_Y(y)) \end{aligned}$$

## Definition

The Kullback Leibler distance (denoted by  $D(P\|Q)$ ) between two distributions  $P$  and  $Q$  where both  $P$  and  $Q$  are defined over the same probability support space  $supp(P)$  is defined as

$$D(P\|Q) = \sum_{u \in supp(P)} P(u) \log \frac{P(u)}{Q(u)}. \quad (2)$$

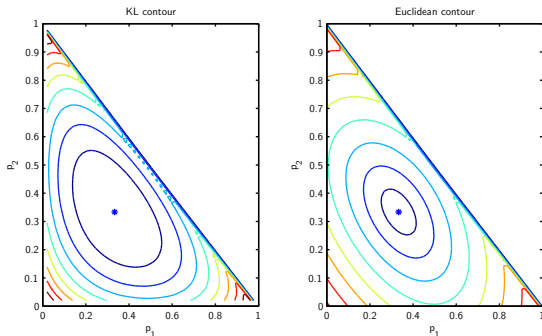

- ▶ Think of it as a distance between two distributions
- ▶ Has many (not all) properties of a metric (say Euclidean distance).

# KL ball

- ▶ Not quite the Euclidean ball!

# KL versus Euclidean distance

- ▶ Not everything is circular!

## Game 2: Linear Universal Decoder

Let

$$\begin{aligned}\mu &\doteq P_{X,Y}(x,y) = P_X(x)W(y|x) \\ \mu^P &\doteq P_X(x)P_Y(y) = P_X(x) \circ W(y|x).\end{aligned}$$

mutual information  $I(X; Y)$  is,

$$I(W) \doteq D(\mu \| \mu^P).$$

# Symmetric (Channel) capacity

Channel capacity  $C(W)$  is given by

$$C(W) = \inf_{P_X} I(P_X, W) = \inf_{P_X} D(\mu \| \mu^P)$$

Symmetric capacity  $I(W)$  is mutual information when  $P_X$  is uniform.

$$I(W) = \inf_{P_X(x) = \frac{1}{X}} D(\mu \| \mu^P)$$

- ▶ Recall that for binary channels  $I(W) \geq 0.94C(W)$ .
- ▶ We are happy when we can do 94% of what the happiest lot do.

# Game 2: Linear Decoders for Compound BMC

## Game 2: Linear Decoders for Compound BMC

- ▶ Compound sets which are convex admit linear decoders [Csiszar, Narayan 1995]

## Game 2: Linear Decoders for Compound BMC

- ▶ Compound sets which are convex admit linear decoders [Csiszar, Narayan 1995]
- ▶ Beyond convex possible! One sided sets admit linear decoders [Abbe,Zheng 2008]

## Game 2: Linear Decoders for Compound BMC

- ▶ Compound sets which are convex admit linear decoders [Csiszar, Narayan 1995]
- ▶ Beyond convex possible! One sided sets admit linear decoders [Abbe,Zheng 2008]
- ▶ Union of one sided sets also admit generalized linear decoder![Abbe,Zheng 2008]

# One sided sets

A set  $\mathcal{S}$  is one sided if the following inequality is satisfied by all channels  $\mu_0$  in the set  $\mathcal{S}$ .

$$D(\mu_0 \| \mu_{\mathcal{S}}^p) \geq D(\mu_0 \| \mu_{\mathcal{S}}) + D(\mu_{\mathcal{S}} \| \mu_{\mathcal{S}}^p)$$

where  $W_{\mathcal{S}}$  is the worst channel in the set  $\mathcal{S}$ , given by,

$$W_{\mathcal{S}} = \arg \min_{W \in \mathcal{S}} I(P_X, W)$$

# One sided sets

A set  $\mathcal{S}$  is one sided if the following inequality is satisfied by all channels  $\mu_0$  in the set  $\mathcal{S}$ .

$$D(\mu_0 \| \mu_{\mathcal{S}}^p) \geq D(\mu_0 \| \mu_{\mathcal{S}}) + D(\mu_{\mathcal{S}} \| \mu_{\mathcal{S}}^p)$$

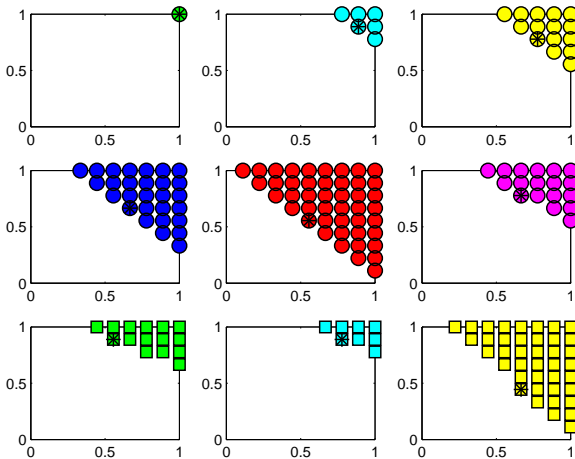

where  $W_{\mathcal{S}}$  is the worst channel in the set  $\mathcal{S}$ , given by,

$$W_{\mathcal{S}} = \arg \min_{W \in cl(\mathcal{S})} I(P_X, W)$$

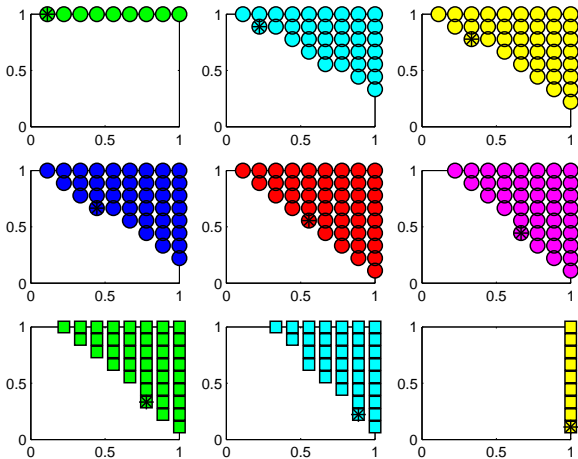

We can think of geometry now

# One sided sets

# One sided sets

# One sided sets: Characteristics

$$\Gamma_S^{\text{onesided}}(W_S) = \left\{ a, b \mid \frac{b - b_S}{a - a_S} \geq -\eta(W_S) \right\}$$

where

$$\eta(W_S) = \frac{\log \left( \frac{a_S}{1-a_S} \frac{1-a_S+b_S}{1+a_S-b_S} \right)}{\log \left( \frac{b_S}{1-b_S} \frac{1+a_S-b_S}{1-a_S+b_S} \right)}$$

# Union of one sided sets

Can we go beyond union of one sided sets?

**YeS!**

## Theorem

*There exists a linear codebook and a generalized linear decoder such that by using this code on any binary symmetric channel  $W$ , the symmetric capacity  $I(W)$  is achieved.*

We get to MMI!Game 2 over.

# Arbitrary BMC

## Lemma

With Generalized Maximum A Posteriori (GMAP) rule, induced by two single letter metrics  $d_1, d_2$ ,

$$d_1(y, x) = \log \frac{W_1(y|x)}{W_1(y|0) + W_1(y|1)}, \quad W_1 = \text{BMC}(a_1, a_1)$$

$$d_2(y, x) = \log \frac{W_2(y|x)}{W_2(y|0) + W_2(y|1)}, \quad W_2 = \text{BMC}(1 - a_1, 1 - a_1),$$

the symmetric capacity  $I(W)$  can be achieved for any binary memoryless channel  $W$ .

For a BMC  $W_0$ , and for any  $a_1 \in [0, 1]$ , a (mismatched) decoder tuned to one of the channels  $W_1 = (a_1, a_1)$  or  $W_2 = (1 - a_1, 1 - a_1)$  achieve the symmetric capacity  $I(W)$ .

## Lemma

Let  $\mathcal{B}^+$  be the set of BMCs with  $a + b \leq 1$ . For any BMC  $W_0 \in \mathcal{B}^+$ , with a mismatched decoder tuned to a BSC  $W_1$  from the same region, i.e.,  $W_1 \in \mathcal{B}^+$  the following rate  $I_{mis}(W_0, W_1)$  can be achieved.

$$I_{mis}(W_0, W_1) = D(\mu_0 \| \mu_0^p)$$

$$I_{\text{mis}}(W_0, W_1) = \inf_{\substack{\mu: \mu^P = \mu_0^P \\ \mathbb{E}_\mu[d_1] \geq \mathbb{E}_{\mu_0}[d_1]}} D(\mu \| \mu_0^P)$$

$$\begin{aligned}
 I_{\text{mis}}(W_0, W_1) &= \inf_{\substack{\mu: \mu^P = \mu_0^P \\ \mathbb{E}_\mu[d_1] \geq \mathbb{E}_{\mu_0}[d_1]}} D(\mu \| \mu_0^P) \\
 &= \begin{cases} \inf_{\substack{\mu: \frac{a-a_0}{b-b_0} = \frac{1+a_0-b_0}{1+b_0-a_0} \\ a+b \leq a_0+b_0, a_1 \leq \frac{1}{2}}} D(\mu \| \mu_0^P), & W_1 \in \mathcal{B}^+ \\ \inf_{\substack{\mu: \frac{a-a_0}{b-b_0} = \frac{1+a_0-b_0}{1+b_0-a_0} \\ a+b \geq a_0+b_0, a_1 \geq \frac{1}{2}}} D(\mu \| \mu_0^P), & W_1 \in \mathcal{B}^- \end{cases}
 \end{aligned}$$

$$\begin{aligned}
I_{\text{mis}}(W_0, W_1) &= \inf_{\substack{\mu: \mu^P = \mu_0^P \\ \mathbb{E}_\mu[d_1] \geq \mathbb{E}_{\mu_0}[d_1]}} D(\mu \| \mu_0^P) \\
&= \begin{cases} \inf_{\substack{\mu: \frac{a-a_0}{b-b_0} = \frac{1+a_0-b_0}{1+b_0-a_0} \\ a+b \leq a_0+b_0, a_1 \leq \frac{1}{2}}} D(\mu \| \mu_0^P), & W_1 \in \mathcal{B}^+ \\ \inf_{\substack{\mu: \frac{a-a_0}{b-b_0} = \frac{1+a_0-b_0}{1+b_0-a_0} \\ a+b \geq a_0+b_0, a_1 \geq \frac{1}{2}}} D(\mu \| \mu_0^P), & W_1 \in \mathcal{B}^- \end{cases} \\
&= \begin{cases} D(\mu_0 \| \mu_0^P) & a_1 \leq \frac{1}{2} \\ 0 & a_1 \geq \frac{1}{2} \end{cases} \\
&= D(\mu_0 \| \mu_0^P)
\end{aligned}$$

# Proof of main theorem

We need to prove,

$$\inf_{\substack{\mu: \mu^P = \mu_0^P \\ \mathbb{E}_\mu d_1 \vee \mathbb{E}_\mu d_2 \geq \mathbb{E}_{\mu_0} d_1 \vee \mathbb{E}_{\mu_0} d_2}} D(\mu \| \mu_0^P) = D(\mu_0 \| \mu_0^P)$$

# Proof of main theorem
