Problem Statement

- Measurements of numbers of moles $n(t)$, mass $m(t)$ and reactor temperature $T(t)$ are available

- Assumption: Stoichiometry, inlet composition and initial conditions are known but no information is available on the reaction kinetics
- Can we detect faults using only data from the current batch?
- The answer is Yes, using the extent-based approach...

Material Balance Equations

- For a reaction system with S species, R reactions, p inlets and one outlet,

Mole balances for S species

$$\dot{\mathbf{n}}(t) = \mathbf{N}^T V(t) \mathbf{r}(t) + \mathbf{W}_{in} \mathbf{u}_{in}(t) - \frac{u_{out}(t)}{m(t)} \mathbf{n}(t), \quad \mathbf{n}(0) = \mathbf{n}_0$$

(S) ($S \times R$) (R) ($S \times p$) (p)

where,

$$\dot{m}(t) = \mathbf{1}_p^T \mathbf{u}_{in}(t) - u_{out}(t), \quad m(0) = m_0,$$

$$\omega(t) = -\frac{u_{out}(t)}{m(t)}$$

Fault
Detection

Conclusion

- The energy balance equation can be written as:

Heat balance

$$\dot{Q}(t) = (-\Delta H)^T \mathbf{r}_v(t) + q_{ex}(t) + \check{\mathbf{T}}_{in}^T \mathbf{u}_{in}(t) - \omega(t) Q(t) \quad Q(0) = Q_0$$

where $Q(t) = m(t)c_p T(t)$ is the heat power

$\check{\mathbf{T}}_{in}^T$ contains the specific heats of the inlet streams

Balance Equations

- Combining both equations

Combined material and energy balance

$$\dot{\mathbf{z}}(t) = \mathcal{A} \mathbf{r}_v(t) + \mathbf{b} q_{ex}(t) + \mathcal{C} \mathbf{u}_{in}(t) - \omega(t) \mathbf{z}(t)$$

$$\mathbf{z} = \begin{bmatrix} \mathbf{n} \\ Q \end{bmatrix} \text{ and } \mathbf{z}_0 = \begin{bmatrix} \mathbf{n}_0 \\ Q_0 \end{bmatrix}.$$

$$\mathcal{A} = \begin{bmatrix} \mathbf{N}^T \\ (-\Delta \mathbf{H})^T \end{bmatrix}, \mathbf{b} = \begin{bmatrix} \mathbf{0}_S \\ 1 \end{bmatrix}, \mathcal{C} = \begin{bmatrix} \mathbf{W}_{in} \\ \check{\mathbf{T}}_{in}^T \end{bmatrix}$$

Conclusion

- The linear transformation $\mathcal{T} = [\mathcal{A} \ \mathbf{b} \ \mathcal{C} \ \mathbf{z}_0 \ \mathbf{P}]^{-1}$ gives,

$$\begin{bmatrix} \mathbf{x}_r(t) \\ x_{ex}(t) \\ \mathbf{x}_{in}(t) \\ x_{ic}(t) \\ \mathbf{x}_{iv}(t) \end{bmatrix} = \mathcal{T} \mathbf{z}(t)$$

- The matrix \mathbf{P} describes the q -dimensional null space of the matrix $[\mathcal{A} \ \mathbf{b} \ \mathcal{C} \ \mathbf{z}_0]$, with $q = S - R - p - 1$.

Linear Transformation

- The transformed system reads

$$\dot{\mathbf{x}}_r(t) = \mathbf{r}_v(t) - \omega(t) \mathbf{x}_r(t) \quad \mathbf{x}_r(0) = \mathbf{0}_R$$

$$\dot{x}_{ex}(t) = q_{ex}(t) - \omega(t) x_{ex}(t) \quad x_{ex}(0) = 0$$

$$\dot{\mathbf{x}}_{in}(t) = \mathbf{u}_{in}(t) - \omega(t) \mathbf{x}_{in}(t) \quad \mathbf{x}_{in}(0) = \mathbf{0}_p$$

$$\dot{x}_{ic}(t) = -\omega(t) x_{ic}(t) \quad x_{ic}(0) = 1$$

$$\mathbf{x}_{iv}(t) = \mathbf{0}_q ,$$

- The numbers of moles $\mathbf{n}(t)$ and the heat $Q(t)$ can be reconstructed from the transformed variables:

$$\begin{bmatrix} \mathbf{n}(t) \\ Q(t) \end{bmatrix} = \begin{bmatrix} \mathbf{N}^T \\ (-\Delta \mathbf{H})^T \end{bmatrix} \mathbf{x}_r(t) + \begin{bmatrix} \mathbf{0}_S \\ 1 \end{bmatrix} x_{ex}(t) + \begin{bmatrix} \mathbf{W}_{in} \\ \check{\mathbf{Y}}_{in}^T \end{bmatrix} \mathbf{x}_{in}(t) + \begin{bmatrix} \mathbf{n}_0 \\ Q_0 \end{bmatrix} x_{ic}(t).$$

Extents

Fault
Detection

Conclusion

- Objective Use extents to identify faults in:
 - ① Outlet flowrates $u_{out}(t)$
 - ② Inlet flowrates $\mathbf{u}_{in}(t)$
 - ③ Heat exchange $q_{ex}(t)$
- Note: In order to identify faults in reactions, we need either historical data or a kinetic model

Fault Detection - Fault in Flowrates

to Vessel
Extents

Fault
Detection

Conclusion

- Compute the reference mass $m_{ref}(t)$

$$\dot{m}_{ref}(t) = \mathbf{1}_p^T \mathbf{u}_{in,ref}(t) - u_{out,ref}(t) \quad m_{ref}(0) = m_{ref,0}$$

- Compare $m_{ref}(t)$ with the measured mass $m(t)$ using either z-test or t-test
- If an error is detected, **fault either in $\mathbf{u}_{in}(t)$ and/or $u_{out}(t)$**

Fault Detection - Fault in Flowrates

Extents for
Process
Monitoring

- Compute the extents by applying the linear transformation
- Compute $x_{ic,ref}(t)$

$$x_{ic,ref}(t) = -\frac{u_{out,ref}(t)}{m_{ref}(t)}x_{ic,ref}(t)$$

- Compare $x_{ic,ref}(t)$ with $x_{ic}(t)$ - **Error in outlet flowrate?**
- Compute $\mathbf{x}_{in,ref}(t)$

$$\mathbf{x}_{in,ref}(t) = \mathbf{u}_{in,ref}(t) - \frac{u_{out,ref}(t)}{m_{ref}(t)}\mathbf{x}_{in,ref}(t)$$

- Compare $\mathbf{x}_{in,ref}(t)$ with $\mathbf{x}_{in}(t)$ - **Error in inlet flowrates?**

Energy Balance
Equations

Transformation
to Vessel
Extents

Fault
Detection

Conclusion

- Consider the hydrodealkylation reaction system

- Both reactions are exothermic
- Simplification: Hydrogen is considered as a dissolved species fed directly into the liquid phase

Material Balance
Equations
Energy Balance
Equations

Transformation
to Vessel
Extents

Fault
Detection

Conclusion

- For the hydrodealkylation example, under normal operating conditions (NOC), \mathbf{n} and T vary with time
- The measurements are corrupted with 1% zero-mean gaussian white noise

Fault Detection - Fault in u_{out}

Extents for
Process
Monitoring

Equations
Energy Balance
Equations

Transformation
to Vessel
Extents

Fault
Detection

Conclusion

- NOC: $u_{out}(t) = 0.5 \text{ kg min}^{-1}$ AOC: $u_{out}(t) = 0 \text{ kg min}^{-1}$
- Fault introduced at time $t = 30 \text{ min}$.

Fault Detection - Fault in \mathbf{u}_{in}

- NOC: $\mathbf{u}_{in}(t) = 0.2 \text{ kg min}^{-1}$ AOC: $\mathbf{u}_{in}(t) = 0 \text{ kg min}^{-1}$
- Fault introduced at time $t = 30 \text{ min}$.

Fault Detection - Fault in $q_{ex}(t)$

- The wrong heat transfer coefficient (UA) was used
- NOC: $UA = 500 \text{ W K}^{-1}$ AOC: $UA = 5 \text{ W K}^{-1}$

Conclusion

Extents

Fault
Detection

Conclusion

- The transformation to extents gives variables that depend on a single rate process → easier to detect a fault associated with that rate
- This allows isolation of faults *without knowledge of kinetics*
- The method requires a proper statistical framework - Generalized Likelihood Ratio (GLR) tests
- GLR also helps detect sensor faults
- Thank you for your attention!
