Demand models in transportation

- Supply = infrastructure
- Demand = behavior, choices
- Congestion = mismatch

Image: Image:

→ ∃ →

Aggregate demand

- Homogeneous population
- Identical behavior

Image: Image:

- Price (P) and quantity (Q)
- Demand functions: P = f(Q)
- Inverse demand: $Q = f^{-1}(P)$

A B A A B A

Disaggregate demand

- Heterogeneous population
- Different behaviors
- Many variables:
 - Attributes: price, travel time, reliability, frequency, etc.
 - Characteristics: age, income, education, etc.

→ 3 → 4 3

• Complex demand/inverse demand functions.

Choice models

Behavioral models

- Demand = sequence of choices
- Choosing means trade-offs
- In practice: derive trade-offs from choice models

Choice models

Theoretical foundations

- Random utility theory
- Choice set: C_n
- $y_{in} = 1$ if $i \in C_n$, 0 if not

 $P(i|\mathcal{C}_n) = \frac{y_{in}e^{v_{in}}}{\sum_{i\in\mathcal{C}}y_{jn}e^{V_{jn}}}$

• Logit model:

<ロ> (日) (日) (日) (日) (日)

STRANSP-OR

Bierlaire (EPFL)

July 11, 2017 8 / 34

Logit model

Utility

$$U_{in} = V_{in} + \varepsilon_{in}$$

Choice probability
$$P_n(i|\mathcal{C}_n) = \frac{y_{in}e^{V_{in}}}{\sum_{j\in\mathcal{C}}y_{jn}e^{V_{jn}}}.$$

- Decision-maker n
- Alternative $i \in C_n$

Variables: $x_{in} = (z_{in}, s_n)$

Attributes of alternative *i*: *z*_{in}

- Cost / price
- Travel time
- Waiting time
- Level of comfort
- Number of transfers
- Late/early arrival
- etc.

Characteristics of decision-maker n: s_n

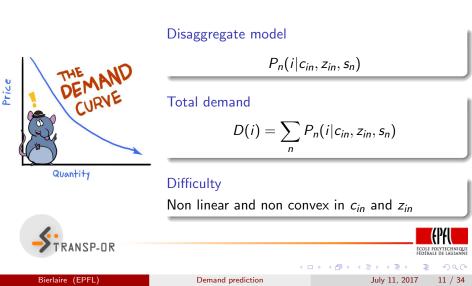

- Income
- Age
- Sex
- Trip purpose
- Car ownership
- Education
- Profession

• etc.

・ロト ・聞ト ・ヨト ・ヨト

Revealed preference

Observe actual behavior

- Representative sample (possibly biased)
- Collect
 - socio-economic characteristics
 - attributes of the alternatives
 - choice
- At one point in time: cross-sectional data
- Several times: panel data

Data

Revealed preference

Advantages

- Real life choices
- Possibility to replicate market shares
- Decision-makers have to assume their choice
- Real constraints involved

Disadvantages

- Limited to existing alternatives and variables
- Lack of variability of some attributes
- No info on non chosen alternatives
- High level of correlation
- Data collection cost
- In general, one individual = one observation

Data

Stated preference

Pick Your Preferred Flight

Three flight options are described for your trip from Chicago to San Diego. These are options that might be available on this route or might be new options actively being considered for this route as well as replacing some options that are offered now. The options differ from each other in one or more of the features described on the left.

Please evaluate these options, assuming that everything about the options is the same except these particular features. Indicate your choices at the bottom of the appropriate column and press the Continue button.

FEATURES	Non-Stop (Option 1)	1 Stop (Option 2)	1 Stop (Option 3)
Departure time (local)	6:00 PM	4:30 PM	6:00 PM
Arrival time (local)	8:14 PM	8:44 PM	9:44 PM
Total time in air	4 hr 14 min	4 hr 44 min	4 hr 44 min
Total trip time	4 hr 14 min	6 hr 14 min	5 hr 44 min
Legroom	typical legroom	2-in more of legroom	4-in more of legroom
Airline [Airplane]	Depart Chicago Continental Airlines [8737] to San Diego	Depart Chicago Southwest Airlines [A320], connecting with Southwest Airlines [MD80] to San Diego	Depart Chicago Northwest Airlines [MD80], connecting with American Airlines [DC9] to San Diego
Fare	\$565	\$485	\$620
1. Which is MOST attractive?	Option 1	🛡 Option 2	💭 Option 3
2. Which is LEAST attractive?	Option 1	9 Option 2	Option 3
3 16 those many the DNI V th		NOT make this bis bu sin 🔍 Yes	
Bierlaire (EPFL)	Dema	nd prediction	July 11, 2017 1

. C

Stated preference

Advantages

- Exploring new alternatives, attributes and attributes levels
- Control of the attributes variability
- Control on all alternatives
- Control on the level of correlation
- One individual can answer several questions

EEDERALE DE LAUSANN

Data

Stated preference

Disadvantages

- Hypothetical situations
- Cannot be used for market shares
- Decision-makers do not have to assume their choice
- "A bike or a Ferrari?" "A Ferrari, of course!"
- Real constraints not involved
- Credibility
- Valid within the range of the experimental design
- Policy bias ("every body else should take the bus")
- Justification bias (or inertia)
- Framing: phrasing of the question matters
- Anchoring: one variable explains it all
- Fatigue effect

Market shares

Sample

- Revealed preference data
- Survey conducted between 2009 and 2010 for PostBus
- Questionnaires sent to people living in rural areas
- Each observation corresponds to a sequence of trips from home to home.
- Sample size: 1723

Model: 3 alternatives

- Car
- Public transportation (PT)
- Slow mode

Example: interurban mode choice in Switzerland

Parameter		Coeff.	Robust Asympt.		
number	Description	estimate	std. error	<i>t</i> -stat	<i>p</i> -value
