

Store-Age, Vertical warehouse for E-Commerce (New York)

Les grandes villes du monde font face à une nouvelle demande, l'E-commerce. L'ensemble des magasins se réinvente pour vendre via internet, derrière le rideau se passe une réorganisation des systèmes pour approvisionner la ville. Nouveaux, habiles, flexibles, nouveaux, adaptés aux besoins d'aujourd'hui ou simplement un tournevis tout est achetable via internet. Mais ce qu'en achète n'apparaît pas magique : des hubs de marchandises complexes, triant, emballant et envoyant nos commandes. Les flux avant immatériels deviennent alors physique et se déplacent dans la ville. Les flux de marchandise sont devenus physiques. Le marché actuel est la plateforme nécessaire pour une bonne redistribution. Connaissant une croissance continue dans le domaine de la vente à distance, + 37 milliard de dollar entre 2014 et 2015 aux USA, les infrastructures de stockage supportant l'E-commerce vont connaître une congestion croissante. C'est pourquoi le projet propose un nouveau modèle d'enfrepôt de stockage.

Store-Age est un gratte-ciel New-Yorkais qui utilise son noyau comme remplacement idéal de stockage et offre des planches lumineuses pour des activités standard. Le gratte-ciel devient alors une pièce technique dans le bon fonctionnement de la ville.

Cette verticalisation du stockage est rendue possible grâce à un assemblage de technologies existantes (produite par Swisslog) ainsi que quelques innovations et la capacité actuelle de gestion des stocks par un traitement numérique.

La robotique implique plusieurs avantages et changement pour le stockage.

- Une accélération du temps de livraison, la commande peut être traitée instantanément et directement emballée. Cela indépendamment de l'heure de commande.

- Une réduction des erreurs, l'utilisation robotique permet une utilisation massive de données sans avoir d'erreurs. Ce qui implique aussi une réduction de logistique inverse, la remise en place d'articles issus d'erreurs.

- Un changement des travailleurs, si les stocks ne demandent pas des compétences à la main d'œuvre, celle-ci nécessite maintenant des ingénieurs en robotique et des informaticiens pour maintenir le système.

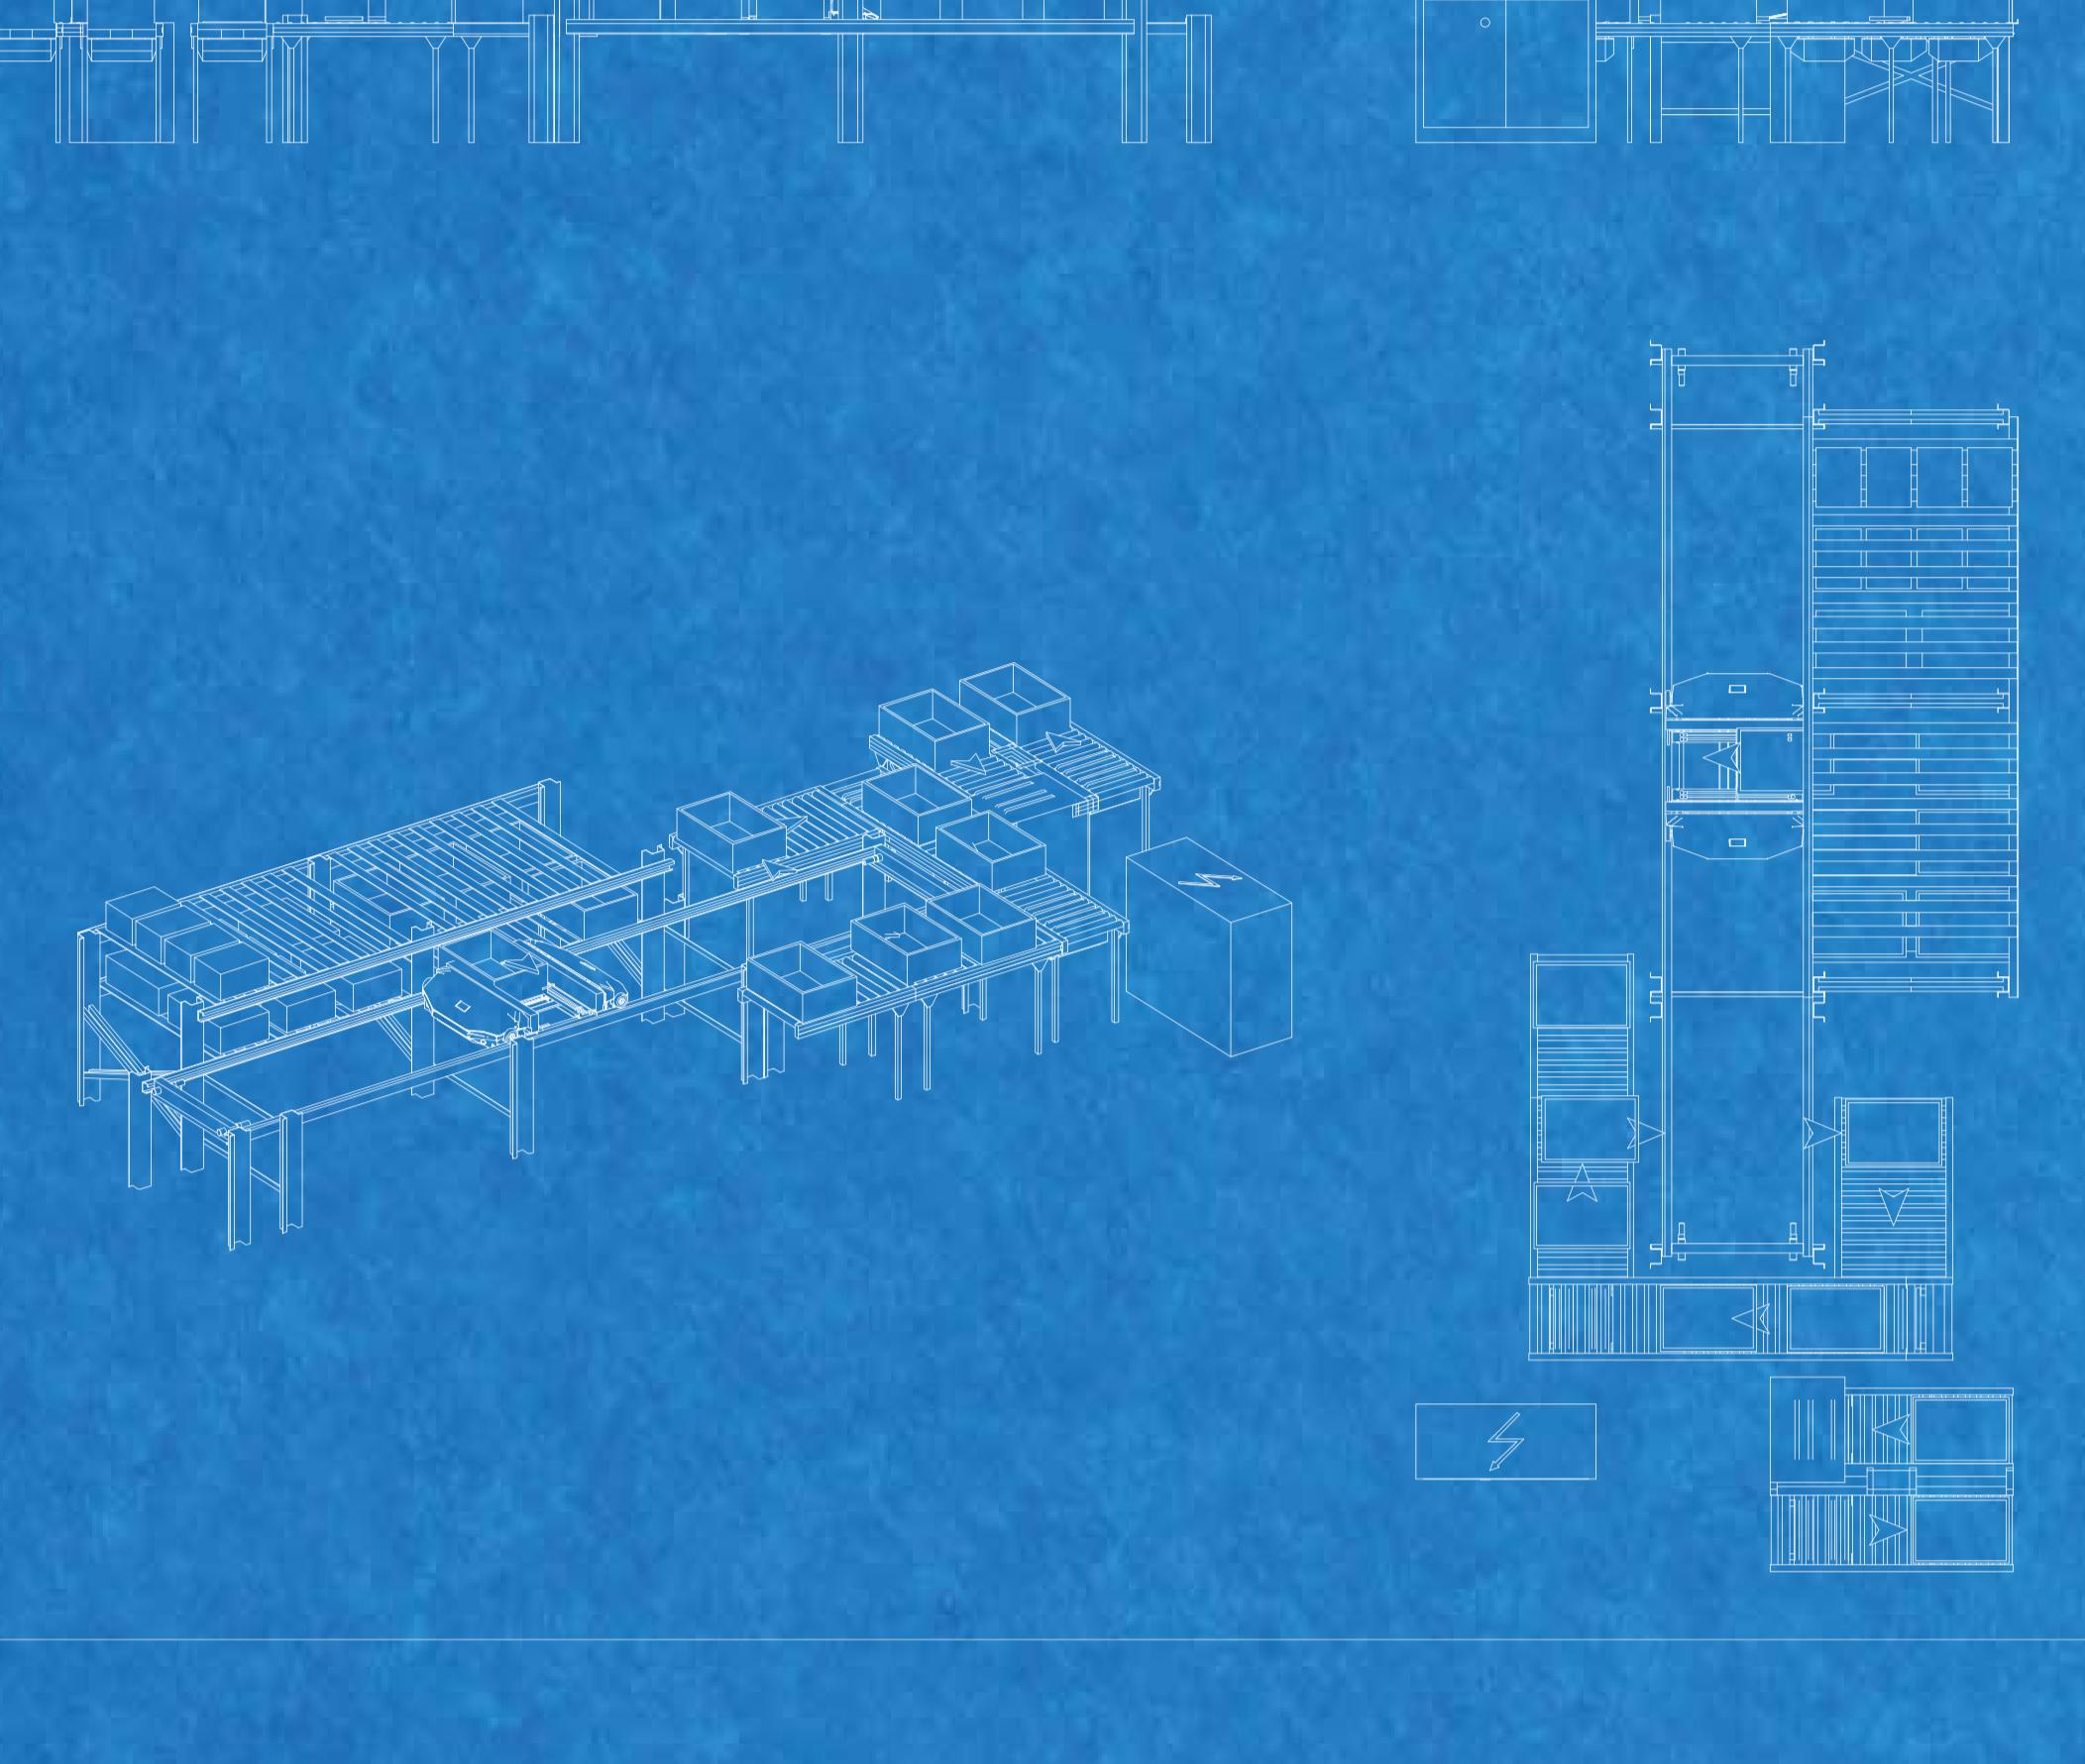

- Le traitement des données prendra en compte les conditions nécessaires aux livraisons (météo, trafic, départ des envois) pour réduire la congestion en métropole.

2 CycloneCarrier:

Shuttle System for Dynamic Storage and Retrieval of Light Goods

The CycloneCarrier shuttle storage and transport system moves cases quickly and safely for improved warehouse efficiency. The shuttle system is particularly well-suited for the requirements of the e-commerce, pharmaceutical and fresh food industry.

Load weight per transport unit: up to 35 kg, standard application
Transport unit dimensions: min. 200 x 200 x 50 mm / max. 450 x 650 x 500 mm
CycloneCarrier vehicle speed: up to 4.0 m/s
CycloneCarrier vehicle acceleration: up to 2.0 m/s²
Lift speed: up to 4.0 m/s
Lift acceleration: up to 7.0 m/s²
Throughput, single-deck version: up to 700 infeeds and outfeeds per hour
Throughput, double-deck version: up to 1 000 infeeds and outfeeds per hour
Lift height: max. 28 m
Temperature range: min. 0 °C, max. 45 °C

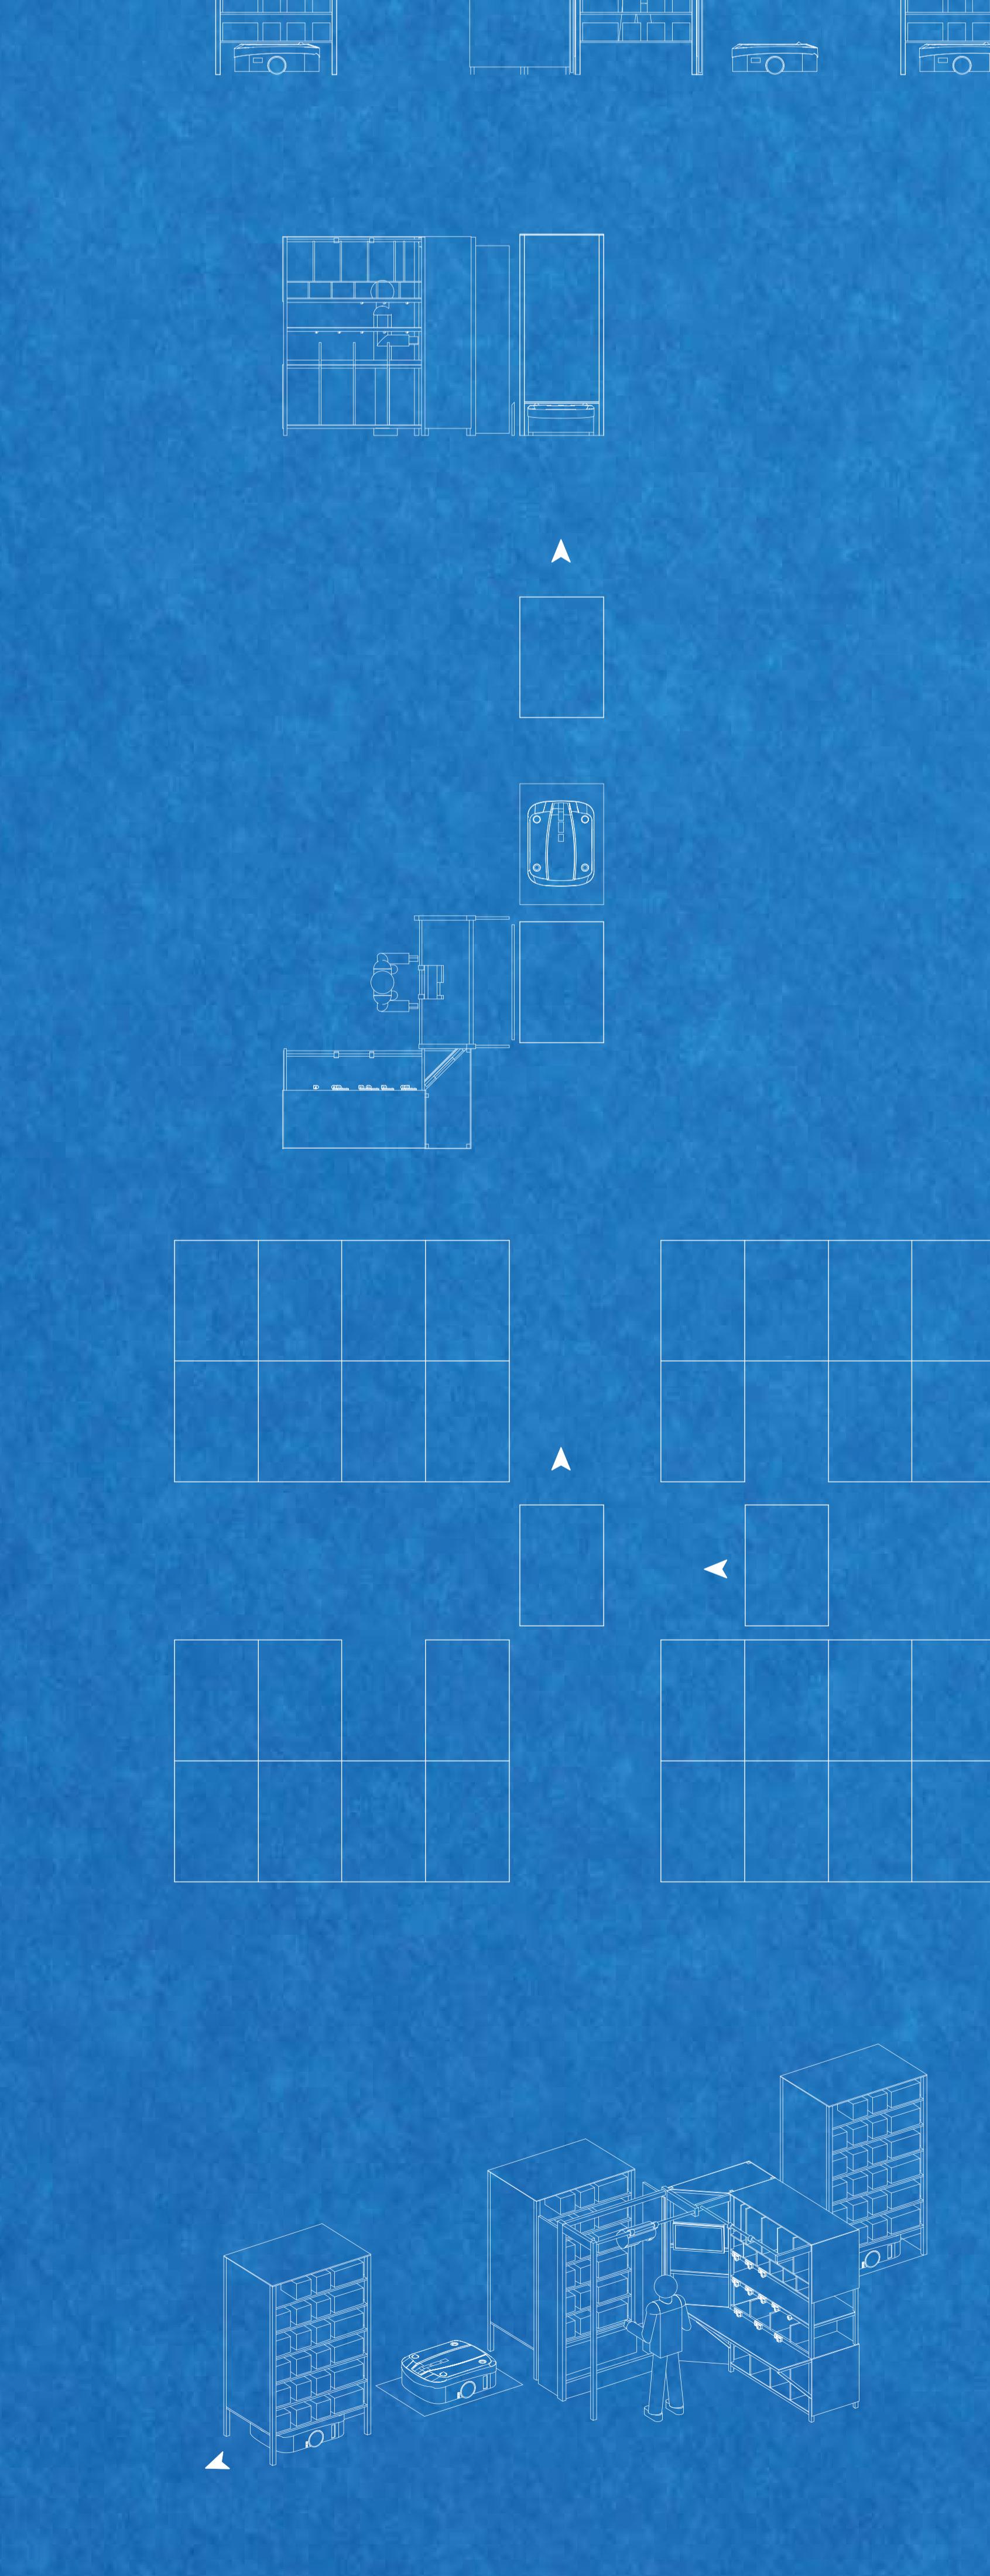

3 CarryPick Mobile System

Efficient Storage and Order Picking

CarryPick is flexible, scalable and quickly adjustable to changing demands in warehousing. The automated storage and goods-to-person order picking system is specifically designed for the intralogistics requirements fulfilling e-Commerce business where product variability, delivery time and cost efficiency are daily challenges.

Mobile racks - dimensions (L x W x H): 1 300 mm x 900 mm x 2 500 mm
Racks - typical load capacity: 1000 kg
'Carry' robots - load max. 600 kg
'Carry' robots - power supply: inductive, charging mats

Today the big cities of the world are facing the new demand, e-commerce. The totality of the shops was reinvented to sell via the internet – the reorganisation of the logistics supply chain happens behind scenes. Food, clothes, electronics and groceries – all are stored in a grid, which can be bought on the internet. However, what we buy doesn't appear magically – the hubs of merchandise are complex, sorting, packing and sending out our orders. Therefore, the flows, appearing to be immaterial, become physical and materialise. The changes in current storage methods are necessary for a good redistribution. The domain of trade in distance has known a continuous growth; for example, more than 37 billion dollars between 2013 and 2014 in the USA. This growth implies that the storage infrastructure supporting the e-economy is facing the increase in congestion. Consequently, the project proposes a new model of warehouse.

Store-Age is a New-York skyscraper which uses its node as an ideal placement for storage as well as proposing the luminous floors for the standard activities. As a result, the skyscraper becomes a technical puzzle piece in the urban well-functioning.

The assembly of the existing technologies (produced by Swisslog), as well as some innovations, makes possible the storage system to be well-suited for the requirements of the e-commerce.

The robotics map many advantages and changes for the storage handling:

- Accelerating the delivery: the command may be treated instantly and be directly packed. This would be done independently from the time of order;
- The minimization of the errors: using the robotics illuminates the human error. This is the best solution for the reduction of the inverted logistics – the handling back of articles issued by a mistake;
- A change of the workforce: the storage wouldn't require physical effort anymore;
- Implementing delivery constraints: the data treatment will take into the account the necessary conditions for delivery (metro, traffic, parcel dispatch) to reduce the congestion in the metropolis.

Shuttle System for Dynamic Storage and Retrieval of Light Goods

The CycloneCarrier shuttle storage and transport system moves cases quickly and safely for improved warehouse efficiency. The shuttle system is particularly well-suited for the requirements of the e-commerce, pharmaceutical and fresh food industry.

Load weight per transport unit: up to 35 kg, standard application

Transport unit dimensions: min. 200 x 200 x 50 mm / max. 450 x 650 x 500 mm

CycloneCarrier vehicle speed: up to 4.0 m/s

CycloneCarrier vehicle acceleration: up to 2.0 m/s²

Lift speed: up to 4.0 m/s

Lift acceleration: up to 7.0 m/s²

Throughput, single-deck version: up to 700 infeeds and outfeeds per hour

Throughput, double-deck version: up to 1 000 infeeds and outfeeds per hour

Lift height: max. 28 m

Temperature range: min. 0 °C, max. 45 °C
