## Acknowledgement

First, I would like to cordially thank Prof. Nicolai Cramerfor supervising my PhD studies and allowing me to work on a very innovative field. I appreciate that he is always open to discussion and gave me his insightful advice that helps find the right direction for the progress of my work. Moreover, he granted me freedom regarding my work, which gave me a chance to improve my chemistry knowledge and learn about managing a project. Additionally, I am grateful for his efforts to organize our cooperative group culture that allows learning with each other.

I would like to thank Prof. Jérôme Waser for taking the duty of being the jury president of my PhD exam. Also, I thank Prof. Jieping Zhu for kindly accepting to become the internal examiner. Furthermore, I would like to express my gratitude to external examiners, Dr. Christian Bruneau and Prof. Carlos Valdés, accepting the invitation for evaluating my thesis manuscript.

I am grateful to Dr. Alissa Götzinger and John Reed for proofreading of my thesis, and to Philipp Seeberger for helpful discussions for preparing my thesis draft.

I sincerely appreciate help from Dr. David Kossler. At the beginning of my PhD, he taught me everything related to lab work in here and share his experience in ruthenium chemistry. I am very thankful to Dr. Yun-Suk Jang for productive discussions and kind help for settling in Switzerland and understanding European cultures. Without his help, it would be more difficult for me living in a foreign country, which is far away from South Korea. In addition, Dr. Johannes Diesel and I were newbies of BCH4412. I appreciated his help and his warm-hearted advice. Working with postdocs in BCH4412, Dr. Michael Dieckmann, Dr. Caio Oliveira and Dr. Alissa Götzinger was enjoyable, and they made a good atmosphere in our lab. Dr. Caio Oliveira made me unforgettable and pleasant memories when we met again in Brazil. I was grateful to work with Qui-Hien Nguyen and Kristers Ozols. I have no doubt that they will keep Vietnamese music in our lab and the hard-working environment as our tradition. Our lovely postdoc Dr. Shou-Guo Wang was warm-hearted and willing to give me kind help and advice. I appreciated all his support for me. I would like to thank Dr. Daria Grosheva, who is a passionate chemist, for helping me whenever I exhausted from teaching courses. I am thankful to Dr. Marcus Brauns, Dr. Gints Smits, Dr. Julia Pedroni, and Dr. Yang Sun, for the time we spent together.

I am grateful for all the former and current group members. They don't hesitate to share their knowledge and skills with other group members. Under the cooperative atmosphere of LCSA, I was able to learn many things from chemistry knowledge to small tips for everyday lives. I would like to thank Dr. Joachim Ahlin, Dr. Christopher Kourra, Dr. Chris Newton, Dr. Chistoph Heinz, Dr. Manh Van Pam, Dr. Laetitia Souillart and Dr. Baihua Ye. Among them, I especially appreciated Dr. Joachim Ahlin for participating in Christmas dinners and shares his experience in the chemical industry. It was a great fortune to work with highly talented colleagues. Discussion with them gave me opportunities for broadening my perspective and having more knowledge. Thus, I am thankful to Dr. Chris Newton, Dr. Solène Miaskiewicz, Dr. Josep Roselló, Dr. Łukasz Wozniak, Dr. Ana Escudero, Coralie Duchemin, Benoît Audic, Elena Braconi, Jin Fay Tan, Vitalii Smal, Aragorn Laverny, Yixuan Cao and Adrien Madron Du Vigné.

Moreover, I appreciated Fabienne Rudin for all her support for administrative works. Thanks to her help, I was able to escape from a bureaucracy swamp. I am thankful to NMR team members, Emily Baudat, Anto Barisic and Dr. Aurélien Bornet, for their supports on maintain our NMRs and resolving issues related to NMR. Furthermore, I would like to thank to our X-ray team, Dr. Rosario Scopelliti, Dr. Euro Solari and Dr. Farzaneh Fadaei Tirani.

Lastly, I would like to thank my family for their unconditional supports. Without their support, I would not move forward for finishing my PhD.

## Abstract

The chemistry of cyclopentadienyl ruthenium(II) complexes plays an important role in ruthenium catalysis because of its high potential for various transformations. However, asymmetric catalysis with chiral cyclopentadienyl ruthenium(II) complexes is still at an infant stage, but rapidly developing because of its expected impact on multiple enantioselective applications.

This thesis discusses the synthesis of a novel class of chiral cyclopentadienyl ligands III, which can be readily accessed by a two-step process from $\alpha, \beta$-unsaturated aldehydes I and cyclopentadiene II. The novel $\mathrm{C}_{2}$-symmetric chiral cyclopentadienyl ligands were complexed with ruthenium(II) and successfully applied in asymmetric catalysis.

I

II

The cyclopentane-fused $\mathrm{Cp}^{\times} \mathrm{Ru}$ complex VI enables the enantioselective synthesis of benzonorcaradienes by coupling of oxa-benzonorbornadienes IV with internal alkynes V in high enantioselectivity (up to 97.5:2.5 er). The reaction mechanism was investigated by computational studies and control experiments.

The chiral cyclopentadienyl ruthenium(II) complexes show promising results for other transformations. An alkylative cycloetherification of allenols and aryl vinyl ketones was investigated
using binaphthyl-derived chiral cyclopentadienyl ruthenium(II) complex X. After an initial optimization study, allenol VIII and phenyl vinyl ketone IX gave the desired enantio-enriched cyclic ether with a promising enantioselective ratio of 90:10.

Furthermore, preliminary studies were undertaken for the [2+1] cycloaddition of enynes via ruthenium vinyl carbenes. Model substrate XII delivered the desired enantio-enriched bicyclo[3.1.0]hexane $\mathbf{X V}$ in a good yield of $72 \%$ ( $E: Z=1.6: 1$ ), with enantiomeric ratios of 72.5:27.5 and 63.5:36.5 for the $E$ - and $Z$-isomer, respectively.

Keywords: ruthenium, cyclopentadienyl ligand, asymmetric catalysis

## Abstract

Cyclopentadienylruthenium(II)-Komplexe spielen eine wichtige Rolle in der Rutheniumkatalyse aufgrund ihres grossen Potentials für eine Vielfalt an Transformationen. Ihr Einsatz in der asymmetrischen Katalyse befindet sich noch in den Kinderschuhen. Sie entwickelt sich jedoch rapide, da eine grosse Bedeutung für enantioselektive Anwendungen zu erwarten ist.

Die Arbeit befasst sich mit der Synthese einer neuen Klasse von chiralen Cyclopentadienylliganden III, die in zwei Schritten einfach zugänglich sind, ausgehend von $\alpha, \beta$-ungesättigten Aldehyden I und Cyclopentadien II.

Diese neue, $\mathrm{C}_{2}$-symmetrische dritte Generation von $\mathrm{Cp}^{\mathrm{x}}$-Liganden wurden mit Ruthenium(II) komplexiert und erfolgreich in katalytischen asymmetrischen Anwendungen eingesetzt.

Die chiralen Cyclopentadienylruthenium(II) -Komplexe ermöglichen die enantioselektive Synthese von Benzonorcaradienen durch Kupplung von Oxabenzonorbonadienen IV mit internen Alkinen V mit einer hohen Enantioselektivität von bis zu 97.5: 2.5 er. Der Reaktionsmechanismus wurde mithilfe von DFT-Rechnungen und Kontrollexperimenten untersucht.

Chirale Cyclopentadienylruthenium(II)Komplexe zeigten ausserdem vielversprechende Ergebnisse für andere Transformationen. Eine alkylierende Cycloveretherung von Allenolen und

Phenylvinylketonen wurde mit dem binaphthyl-basierten chiralen Cyclopentadienylruthenium(II)Komplex $\mathbf{X}$ untersucht. Nach einer anfänglichen Optimierung ergab die Reaktion von Allenol VIII und Phenylvinylketon IX den gewünschten cyclischen Ether im mit einem vielversprechenden Enantiomerenverhältnis von 90:10.

Weitere vorläufige Studien befassten sich mit der [2+1]-Cycloaddition von Eninen XII über Rutheniumvinylcarbene. Das Modellsubstrat XII ergab enantiomerenangereichertes Bicyclo[3.1.0]hexan in einer guten Ausbeute von 72\% mit Enantiomerenverältnissen von 72.5:27.5 und 63.5:36.5 für das $E$ - bzw-. Z-isomer.

Chapter 1 Introduction

### 1.1 Ruthenium in Catalysis

Ruthenium is a transition metal that exhibits abundant reactivity. Its electron configuration is [Kr] 4d ${ }^{7}$ $5 s^{1}$. It can have oxidation states from -2 to +8 , with $+2,+3$ and +4 the most common. ${ }^{1}$ It is more abundant than other platinum group metals, such as iridium and rhodium. ${ }^{2}$ Ruthenium compounds, such as tetra-n-propylammonium perruthenate (TPAP) and ruthenium tetroxide have been used widely for oxidation reactions. ${ }^{3}$ However, they have been utilized not only for oxidation reactions but also for a variety of different transformations. Especially in combination with ligands such as carbonyl, phosphines, cyclopentadienyls, arenes, dienes, and carbenes, ruthenium complexes show versatile reactivities for organometallic reactions. ${ }^{4}$

### 1.1.1 Ruthenium catalyzed reactions without Cp ligands

Olefin metathesis is one of the most representative applications of ruthenium in catalysis. Transitionmetal catalyzed olefin metathesis was discovered in the 1950s, as a process forming ethylene 1.2 and 2-butene 1.3 from propylene 1.1 (Scheme 1-1). ${ }^{5}$

Scheme 1-1: The first reported example of olefin metathesis.
Grubbs and coworkers found that an active catalytic species is Ru (II) by examining ring-opening metathesis of 7 -oxanorbornene in $1988 .{ }^{6}$ In 1995, his student SonBinh Nguyen developed an airstable and the first well-defined ruthenium carbene 1.4 (Figure 1-1). ${ }^{7}$ In the same year, Grubbs reported a simplified ruthenium carbene, which is commercially available and known as the first generation Grubbs catalyst 1.5. ${ }^{8}$ Introducing an $N$-heterocyclic carbene (NHC), a strong $\sigma$-donating ligand, gave what is now known as the second generation Grubbs catalyst 1.6. ${ }^{9}$ Hoveyda reported that a chelating oxygen ligand improves the stability of the ruthenium carbene in $1999,{ }^{10}$ which allows for recycling of the catalyst. Subsequently, the oxygen chelating ligand was combined with the NHC. That novel class of ruthenium carbene, now called the second generation Hoveyda-Grubbs catalyst 1.7, promotes olefin metathesis in a highly efficient manner, and makes the formation of tri- and tetra-substituted olefins feasible. ${ }^{11}$ Most examples of olefin metathesis result in a predominant formation of $E$-olefins, ${ }^{12}$ due to the high reversibility of the transformation. Accessing $Z$-olefin
selectively by olefin metathesis was a challenging topic. Grubbs reported ruthenium catalyst 1.8, which enables a $Z$-selective olefin metathesis. ${ }^{13}$

Ruthenium catalyzed asymmetric hydrogenation has also made a huge impact on both academy and the chemical industry. Noyori and coworkers made huge contributions to this field. ${ }^{14}$ In 1987, they reported the asymmetric hydrogenation of $\beta$-keto esters 1.9 catalyzed by BINAP/ruthenium halide complex 1.10 (Scheme 1-2). ${ }^{15}$

Scheme 1-2: Ruthenium catalyzed asymmetric hydrogenation of $\beta$-keto ester.

The limitation of asymmetric hydrogenation using BINAP ruthenium halides 1.10 (Scheme 1-2) is that unfunctionalized and simple ketones 1.12 cannot be converted. This issue was resolved by development of BINAP/diamine ruthenium systems (1.13 and 1.14) (Scheme 1-3). ${ }^{16}$

Scheme 1-3: Ruthenium catalyzed asymmetric hydrogenation of unfunctionalized ketone.
Noyori expanded his ruthenium chiral diamine system to transfer hydrogenation. Instead of using hydrogen gas, transfer hydrogenation using ruthenium diamine complex (1.16 and 1.17) allows the reduction of unfunctionalized ketones 1.15 using isopropanol as a hydrogen source (Scheme 1-4). ${ }^{17}$

Scheme 1-4: Ruthenium catalyzed transfer hydrogenation of unfunctionalized ketone.

Catalytic C-H functionalization makes a profound impact on synthetic organic chemistry by enabling step-economic and atom-economic approaches to the synthesis of pharmaceutics and natural products. Initially $\mathrm{C}-\mathrm{H}$ functionalization for $\mathrm{C}-\mathrm{C}$ bond formation was examined mostly using palladium or rhodium catalysts, but ruthenium complexes were also investigated. ${ }^{18}$ Murai and coworkers reported $\mathrm{sp}^{2} \mathrm{C}-\mathrm{H}$ a functionalization using a ruthenium(0) precursor in $1993{ }^{19}$, in which the aromatic $\mathrm{C}-\mathrm{H}$ bond in the ortho-position of 1.19 added to an olefin 1.20 (Scheme 1-5).

Murai, 1993

Scheme 1-5: Ruthenium(0) catalyzed $\mathrm{sp}^{2} \mathrm{C}-\mathrm{H}$ functionalization.

Later, Oi's pioneering work enabled C-H functionalizations using a ruthenium(II) catalyst 1.24, which is more convenient to prepare and more stable than ruthenium $(0)$ complexes. The authors showed that the pyridyl group of $\mathbf{1 . 2 3}$ performs well as a directing group for the ortho-position of $\mathbf{1 . 2 3}$ in a ruthenium(II) catalyzed C-H arylation (Scheme 1-6). ${ }^{20}$

$$
\text { Oi, } 2001
$$

Scheme 1-6: Ruthenium(II) catalyzed $\mathrm{sp}^{2} \mathrm{C}-\mathrm{H}$ functionalization with a pyridyl directing group.

Recently, the Larrosa group investigated the mechanistic details of ruthenium(II) catalyzed $\mathrm{C}-\mathrm{H}$ functionalization. They revised the previously proposed $\mathrm{Ru}(\mathrm{II}) / \mathrm{Ru}(\mathrm{IV})$ cycle by suggesting a biscyclometallated ruthenium(II) species as an intermediate. Based on their revised mechanistic proposal, they applied cyclometallated ruthenium complex 1.28 as a catalyst for $\mathrm{C}-\mathrm{H}$ arylation of arylpyridine 1.26 (Scheme 1-7). ${ }^{21}$

Scheme 1-7: $\mathrm{sp}^{2} \mathrm{C}-\mathrm{H}$ functionalization with a cyclometallated ruthenium catalyst.

Enantioselective Diels-Alder reactions have been realized using $\mathrm{Cp}^{*} \mathrm{Rh}(\mathrm{I})$ or $\mathrm{CpFe}(\mathrm{II})$ complexes in combination with chiral bi-dentate phosphine ligands. ${ }^{22}$ A similar reactivity was observed for ( $\eta^{6}$ arene) $R u(I I)$ complexes. Davies and coworkers showed that ( $\eta^{6}$-arene)Ru(II) complex 1.32 can be used as a chiral Lewis acid for enantioselective Diels-Alder reaction (Scheme 1-8). ${ }^{23}$ This reaction provides norbornene 1.33 in an excellent yield of $90 \%$, and with high enantioselectivity (90.5:9.5 er).

Davies, 1997

Scheme 1-8: Enantioselective Diels-Alder reaction catalyzed by the ( $\eta^{6}$-arene)Ru(II) complex 1.32 The application of ruthenium pincer complexes 1.35 was extensively explored on hydrogenation/dehydrogenation and dehydrogenative functionalization reactions, which are highly valuable as eco-friendly transformations for the chemical industry. ${ }^{24}$ Milstein and coworkers explored homogeneous catalysis using ruthenium pincer complexes 1.35. Early on in their investigation of ruthenium pincer complexes, they reported the dehydrogenation of secondary alcohols 1.34 , forming the corresponding ketone 1.36 and hydrogen gas 1.37 (Scheme 1-9). ${ }^{25}$

Scheme 1-9: Dehydrogenation of secondary alcohol by ruthenium pincer complex 1.35.

Beller and coworkers developed a highly efficient process for the evolution of hydrogen gas (1.41) from methanol 1.38. ${ }^{26}$ The state-of-the-art heterogeneous system for methanol (1.38) reforming requires high temperatures (above $200{ }^{\circ} \mathrm{C}$ ) and high pressure ( $25-50$ bar). In contrast to the heterogeneous system, Beller's conditions only need $89-95^{\circ} \mathrm{C}$ and ambient pressure. Furthermore, this process can be used in aqueous methanol.

Beller, 2013

Scheme 1-10: Dehydrogenation of methanol by ruthenium pincer complex 1.40.

The Milstein group also reported the dehydrogenative coupling of alcohols, which is an environmentally benign method for accessing esters 1.45 (Scheme 1-11). ${ }^{25}$ Other dehydrogenative functionalizations for the synthesis of fundamental materials such as acetals and amides were investigated as well. ${ }^{24}$

### 1.1.2 CpRu and Cp*Ru catalyzed reactions

The Trost group has explored various transformations catalyzed by $\mathrm{CpRu}(\mathrm{II})$ and $\mathrm{Cp}{ }^{*} \mathrm{Ru}(\mathrm{II})$ complexes. Their pioneering work has made extensive and profound impact on this field. ${ }^{27}$ Their contribution lies not only in the development of novel transformations, but also mechanistic proposals and studies, which became the ground for new discoveries. ${ }^{28}$ An early examples of $\mathrm{CpRu}(\mathrm{II})$ catalyzed transformation is the addition of alkenes to alkynes (Scheme 1-12). ${ }^{29}$ The coupling between alkenes and alkynes forms 1,4-dienes. This transformation can be seen as a metallo-ene reaction using alkynes as enophiles. In this reaction, a ruthenacyclopentene was proposed as a key intermediate. ${ }^{27 a}$ Oxidative cyclometallation forms ruthenacyclopentenes 1.52 and 1.53 , is followed by syn $\beta$-hydride elimination. The $\beta$-hydride elimination occurs on the exocyclic hydrogen because of geometrical constraints for a syn elimination on an endocyclic hydrogen. Reductive elimination of the resulting ruthenium hydride complexes $\mathbf{1 . 5 4}$ and $\mathbf{1 . 5 5}$ delivers the 1,4-dienes $\mathbf{1 . 5 0}$ and $\mathbf{1 . 5 1}$.

Scheme 1-12: Ruthenium catalyzed alkene-alkyne coupling, forming 1,4-diene.

In an analogous fashion, the coupling of allenes and alkenes to form 1,3-dienes was also investigated. 1,3-Dienes are formed by the addition of allenes 1.56 to Michael acceptors 1.57 (Scheme 1-13). ${ }^{30}$ As for the coupling of alkenes and alkynes, the proposed mechanism is initiated by the formation of a 5 -membered ruthenacycle 1.60 by oxidative cyclometallation. Subsequent $\beta$ hydride elimination gives ruthenium hydride 1.61, which undergoes reductive elimination, regenerating the active $\mathrm{CpRu}(\mathrm{II})$ complex and releasing the 1,3-diene product. A catalytic amount of alkynol 1.62 was added as an activator, which enhances the removal of COD for generating a coordinatively unsaturated CpRu (II) species.

Trost, 1999

Scheme 1-13: Ruthenium catalyzed allene-alkyne coupling, forming 1,3-diene.

The Dixneuf group showed that alkynes have a potential bis-carbene character by demonstrating a double addition of carbenes to a triple bond (Scheme 1-14). ${ }^{31}$ The results of the reaction suggested that the key intermediate is ruthenium vinyl carbene 1.66. In addition, the formation of the ruthenium vinyl carbene 1.66 was also supported by DFT calculations. ${ }^{32}$ After the formation of the ruthenium vinyl carbene $1.66,[2+2]$ cycloaddition, cycloreversion, and a second ruthenium vinyl carbene formation delivers intermediate 1.67. Finally, coupling of both carbenes results in the release of 1,3diene 1.65 .

## Dixneuf, 2000

Scheme 1-14: Double addition of diazocompounds to alkynes.

Itoh and Yamamoto studied ruthenium catalyzed annulation reactions. ${ }^{33}$ They reported the first regioselective ruthenium catalyzed [2+2+2] cycloaddition of unsymmetrical 1,6-diynes 1.68 with terminal alkynes 1.69 (Scheme 1-15). ${ }^{34}$ The reaction selectively provides benzene derivatives, 1.71 and 1.72, with high preference for the meta-isomers 1.71 (88:12-98:2 meta:ortho).

## Itoh Yamamoto, 2000

Scheme 1-15: Regioselective [2+2+2] cycloaddition catalyzed by a $\mathrm{Cp}{ }^{*} \mathrm{Ru}(\mathrm{II})$ complex.

The ruthenium vinyl carbene intermediate was utilized for various catalytic transformations. ${ }^{35}$ For example, the Saá group reported the synthesis of vinyl dihydropyrans using a catalytic ruthenium carbene (Scheme 1-16). ${ }^{36}$ The reaction is initiated by the formation of the ruthenium vinyl carbene from $\mathrm{Cp}^{*} \mathrm{RuCl}(\mathrm{COD})$, followed by coordination of the alkynal or alkynone substrate 1.73. The resulting intermediate 1.77 undergoes [2+2] cycloaddition and cycloreversion, forming the alkenyl carbene 1.78. The intramolecular nucleophilic attack of the carbonyl group on the electrophilic carbene produces zwitterionic intermediate 1.79. The following deprotonation/protonation step gives the desired dihydropyran 1.76.
Saá, 2014

Scheme 1-16: A ruthenium vinyl carbene catalyzed synthesis of vinyl dihydropyrans.

The other known reactivity of $\mathrm{Cp}^{*} \mathrm{Ru}(\mathrm{II})$ complexes is $\mathrm{C}-\mathrm{O}$ bond insertion. Yamamoto and coworkers showed experimental evidence of $\mathrm{C}-\mathrm{O}$ bond insertion by Cp *Ru(II). They performed NMR studies for investigating the mechanistic details of a one-pot double allylation/cycloisomerization of 1,3dicarbonyl compounds (Scheme 1-17). ${ }^{37} \mathrm{Cp}$ *R(COD)Cl 1.80 was exposed to allyl methyl carbonate 1.81 in deuterated benzene. After about 2 h , the reaction mixture contained COD, methanol and two $\pi$-allyl complexes, ruthenium dichloride complex 1.82 and ruthenium methoxo complex 1.83. The formation of $\pi$-allyl complexes 1.82 and 1.83 indicates the oxidative addition of ruthenium complex 1.80 into the $\mathrm{C}-\mathrm{O}$ bond.

Yamamoto, 2004

Scheme 1-17: NMR studies on C-O insertion of Cp*Ru(II) complex.

The Tam group has developed novel transformations with bicyclic alkenes. ${ }^{38}$ Among their discoveries, they found conditions for the isomerization of oxa-benzonorbornadiene 1.84 to 1,2 naphthalene oxide 1.86, which suggests a $\mathrm{C}-\mathrm{O}$ bond inserted key intermediate (Scheme 1-18). In this reaction, the oxidative addition of ruthenium into a $\mathrm{C}-\mathrm{O}$ bond results in ruthenacycle 1.88 , followed by m-ally ruthenium complexation. Subsequent reductive elimination gives 1,2-naphthalene oxide 1.86 .

Besides the reactivities introduced in this section, CpRu and Cp*Ru also exhibit rich chemistry in vinylidene, allenylidene intermediate, ${ }^{39}$ and redox reactions. ${ }^{27 a}$

### 1.2 Precedents of Chiral Cyclopentadienyl Ligands and Complexes

### 1.2.1 General properties of the cyclopentadienyl ligand

Cyclopentadienyl $(\mathrm{Cp})$ is a polyenyl ligand, and mainly forms a stable bond between metal and Cp by a pentahapto $\left(\eta^{5}\right)$ bonding mode. ${ }^{40}$ This bond tends to be tighter than the bond between an arene ligand and a metal because of the additional electrostatic attraction between the partial negative charge of the Cp ligand and the partial positive charge of the metal. ${ }^{41}$ The strong $\eta^{5}$ bounding of the Cp ligand and its inert characteristics toward nucleophiles and electrophiles make it a representative spectator ligand.

Most cyclopentadienyl complexes can be classified as four types of complexes (Figure 1-2). The first class contains metal complexes with three cyclopentadienyl ligands, $\mathrm{Cp}_{3} \mathrm{M}$ (1.90). This type of cyclopentadienyl complexes is usually found with lanthanide or actinide metals. ${ }^{42}$

The metallocenes, $\mathrm{Cp}_{2} \mathrm{M}$, constitute the second class of cyclopentadienyl complexes. Because of their structure, they are also called sandwich complexes. The metallocenes play an important role in the history of organometallic chemistry (1.91). The most famous example of $\mathrm{Cp}_{2} \mathrm{M}$ is ferrocene $\left(\mathrm{Cp}_{2} \mathrm{Fe}\right)$. In 1951, Kealy and Pauson first reported $\mathrm{Cp}_{2} \mathrm{Fe}$, in which they proposed monohapto ( $\eta^{1}$ ) bondings of the Cp ligands. ${ }^{43}$ Miller, Tebboth, and Tremaine discovered ferrocene independently. Even though they submitted their manuscript about a month earlier than Kealy and Pauson, it was only published in $1952 .{ }^{44}$ In the same year, the structure of ferrocene was re-assigned by two independent groups. Wilkinson and Woodward suggested the correct structure, ${ }^{45}$ which was supported by X-ray-crystallographic data from Fischer. ${ }^{46} \mathrm{Cp}_{2} \mathrm{Fe}$ can undergo Friedel-Craft acylation reactions similar to benzene. ${ }^{47}$

Bent metallocenes, $\mathrm{Cp}_{2} \mathrm{ML}_{\mathrm{x}}(\mathrm{x}=1-3)$, carry two Cp ligands that are not parallel to each other (1.92). The number of additional ligands $L$ ranges from 1 to 3 . The major application of bent metallocenes is olefin polymerization. Conditions developed by Kaminsky and coworkers use $\mathrm{Cp}_{2} \mathrm{ZrCl}_{2}$ and trialkyl aluminum and are the current standard procedure for homogeneous Ziegler-Natta catalysis, . ${ }^{48}$

Half-sandwich complexes, $\operatorname{CpML}_{x}(x=14)$ contain a single Cp ligand with additional ligands, and have been investigated extensively (1.93). They have piano-stool structure, picturing Cp as the seat and the additional ligands as the legs of a stool. When the "legs" are labile ligands, the complexes are prone to generating coordinatively unsaturated intermediates, opening a manifold of possible applications in catalysis. ${ }^{27 a}$

### 1.2.2 Early stage of development of chiral cyclopentadienyl ligands

Assessing optically pure compounds is one of the major challenges in organic synthesis, because optical purity plays a crucial role in biological activity. This results in high demand for optically pure compounds for pharmaceutical applications. ${ }^{49}$ For this reason, the development of enantioselective catalysis has a priority in the synthetic organic community. To this end, chiral cyclopentadienyl metal complexes have been investigated for the development of enantioselective transformations. There are three approaches to create a chiral environment on cyclopentadienyl metal complexes (Figure $1-3) .{ }^{50}$ The first way is applying a chiral bidentate ligand, such a diol, ${ }^{51}$ diamine, ${ }^{52}$ or diphosphine ${ }^{53}$ (1.94) in combination with the Cp ligand. An advantage of the approach is that known bidentate ligands from chiral ligand libraries can be utilized. However, the drawback of the method is that only a single free coordination side is left on the metal. Hence, cyclopentadienyl metal complex with a chiral bidentate ligand cannot be utilized for transformations that require two or more coordination sites. The second approach is using a ligand tethered to the Cp moiety, such as a phosphine ${ }^{54}$ or a sulfoxide ${ }^{55}$ (1.95). This type of complex has two vacant coordination sites, and these ligands were successfully applied for enantioselective allylic substitution. However, most transformations of interest require need three vacant coordination sites on the metal, rendering this approach unsuitable as well. In addition, the coordinating additional ligands change the electronic properties of the metal center and the steric bulk of the additional ligand can have an adverse effect on the reactivity of the metal complexes. The third method is introducing chirality on the cyclopentadienyl ring without an additional ligand, $\mathrm{Cp}^{\mathrm{x}},(1.96)$. As the $\mathrm{Cp}^{\mathrm{x}}$ ligands do not require additional ligands, there are three available coordination sites on the active species. For this reason, $\mathrm{Cp}^{\times} \mathrm{M}$ complexes can be applied for a large variety of transformations. ${ }^{56}$

1.95

Figure 1-3: Three types of chiral cyclopentadienyl complexes with an increasing number of available coordination sites.

Kagan and coworkers reported early examples of chiral cyclopentadienyl ligands and complexes withgroup 4 metals, such as Ti and Zr . They synthesized menthylcyclopentadiene 1.98 from (-)menthol (1.97). ${ }^{57}$ This monosubstituted chiral cyclopentadienyl ligand was deprotonated with $n$-BuLi, and subsequent metalation with $\mathrm{TiCl}_{4}$ or $\mathrm{ZrCl}_{4}$ resulted in metallocene complexes 1.99 and 1.100 (Scheme 1-19a). They demonstrated the application of menthyl $\mathrm{CpMCl}_{2}$ complexes 1.99 in asymmetric hydrogenation, obtaining sec-butylbenzene 1.102 in 57.5:42.5 er (Scheme 1-19).

b) Asymmetric hydrogenation

Scheme 1-19: Synthesis of methyl $\mathrm{Cp}_{2} \mathrm{MCl}_{2}$ and its application in asymmetric hydrogenation.

For the next generation of chiral cyclopentadienyl ligands, annulated Cp derivatives ( $\mathrm{Cp}^{\times}$) were employed. Vollhardt synthesized $\mathrm{C}_{1}$-symmetric chiral cyclopentadiene $\mathbf{1 . 1 0 4}$ from (+)-camphor in 1988. Metalation of the ligand resulted in titanocenes $\mathbf{1 . 1 0 5}$ and 1.106. The titanium complexes showed catalytic activity for asymmetric hydrogenation, even though the enantioselectivity was low (Scheme 1-20). ${ }^{58}$ In Vollhardt's case, the complexation resulted in a diastereomeric mixture of titanocene 1.105 and 1.106 in $95: 5 \mathrm{dr}$, causing difficulties in the purification process. Recrystallization finally gave pure 1.105 in $11 \%$ yield.

## Vollhardt, 1988

Scheme 1-20: Synthesis of $C_{1}$-symmetric chiral cyclopentadienyl ligand

In 1990, Erker developed $\mathrm{C}_{2}$-symmetric (+)-camphor derived chiral cyclopentadienyl ligand 1.108, (Scheme 1-21). Zirconium trichloride 1.109 was prepared in $40 \%$ yield, much improved compared the complexation step of Vollhardt's $C_{1}$-symmetric ligand. Because of the $\mathrm{C}_{2}$-symmetry the same zirconium complex is generated regardless of the approaching face of the metal precursor to the chiral ligand 1.108, preventing the formation of a diastereomeric mixture. Zirconium trichloride 1.109 catalyzed the enantioselective electrophilic aromatic substitution of 1-naphthol 1.110 (Scheme 1-21). Reaction with ethyl pyruvate 1.111 resulted in the tertiary alcohol $\mathbf{1 . 1 1 2}$ in $56 \%$ yield with high enantioselectivity ( $92: 8$ er). This example shows that $C p^{x}$ ligands can achieve high enantioinduction.

b) Enantioselective electrophilic aromatic substitution

Erker, 1990

Scheme 1-21: Synthesis of $\mathrm{C}_{2}$-symmetric chiral cyclopentadienyl ligand 1.108 and its application in electrophilic aromatic substitution.

After Heller's work in 2004, the field plateaued. He applied Erker's menthylindenyl ligand ${ }^{59}$ on cobalt, and developed its application in an enantioselective [2+2+2] cyclization ${ }^{60}$ (Scheme 1-22). Nucleophilic substitution of lithium indenylide on tosylated menthol $\mathbf{1 . 1 1 3}$ gave menthyl indenyl ligand 1.114. The chiral indenyl cobalt complex $\mathbf{1 . 1 1 5}$ was prepared by a sequence of deprotonation of 1.114 , transmetalation to $\mathrm{Co}\left(\mathrm{PPh}_{3}\right)_{3} \mathrm{Cl}$, and substitution of COD . The resulting cobalt complex 1.115 successfully catalyzed the reaction and produced the desired tetrahydroisoquinolines 1.118 in good to very good yields (up to 86\%) and high enantioselectivities (up to 96.5:3.5 er).

Scheme 1-22: Synthesis of chiral indenyl cobalt complex 1.115 and its application in an enantioselective $[2+2+2]$ cyclization.

The ligands introduced above were synthesized from the chiral pool, which expedites the access to chiral cyclopentadienyl ligands. However, the shortcoming of this approach is that it is difficult to modify and fine-tune toward a desired transformation. For this reason, research on more easily modifiable chiral $\mathrm{Cp}^{\mathrm{x}}$ ligands became inevitable.

### 1.2.3 The advancement of chiral cyclopentadienyl ligand development

Our group has reported a novel class of $\mathrm{Cp}^{\mathrm{x}}$ ligands in $2012 .{ }^{61}$ The ligands were designed based on the hypothesis that there are two requirements for enantioinduction by $\mathrm{Cp}^{\mathrm{x}}$ ligands. The first condition is that the equilibrium between two tricoordinated conformations should be far on one side (1.119 and $\mathbf{1 . 1 2 0}$ in Scheme 1-23a), which is a prerequisite for a facial selectivity. The second condition is that the third ligand $\left(L^{3}\right)$ needs to approach the metal center from the same face, as $L^{3}$ approaches from the right side of the metal center of $\mathbf{1 . 1 2 0}$ in Scheme 1-23a. Piano-stool complex $\mathbf{1 . 1 2 1}$ fulfills both requirements and exhibits a single absolute stereochemistry. With the prerequisites in mind, a rough design of a $\mathrm{Cp}^{\mathrm{x}}$ ligand was proposed (Scheme 1-23b). The steric clash between the side wall (blue spheres in Scheme 1-23b) and the large ligand ( $L^{L}$ ) shifts the equilibrium to the tricoordinated complex 1.123. In addition, the back wall (red ellipse in Scheme 1-23b) blocks the approach of $\mathrm{L}^{3}$ from the left side of the metal center. As a result, a single enantiomer of metal complex $\mathbf{1 . 1 2 4}$ is obtained. In addition, the hypothesis envisions the fine tuning of a $\mathrm{Cp}^{\mathrm{x}}$ by modifying the side wall or the back wall.
(a) Requirements for $\mathrm{Cp}^{\mathrm{x}}$

(b) Rough design of a $\mathrm{Cp}^{\mathrm{x}}$ ligand

Scheme 1-23: Requirements for $\mathrm{Cp}^{\mathrm{x}}$ and a rough design of a $\mathrm{Cp}^{\mathrm{x}}$ ligand

Our group's cyclohexane-fused $\mathrm{Cp}^{\mathrm{x}}$ ligand fulfill the two conditions mentioned above. The fused 1,3dioxolane ring and $R^{2}$ groups work as back wall and side walls, respectively (Scheme 1-24a). Moreover, the ligand $\mathbf{1 . 1 2 5}$ has a modifiable back wall, and is $\mathrm{C}_{2}$-symmetric, thus preventing the
formation of a problematic diastereomeric mixture during complexation to the metal. $\mathrm{Cp}^{\times}$ligand 1.125 was synthesized from D-mannitol via 5-7 step-synthesis. Deprotonation of the ligand $\mathbf{1 . 1 2 5}$ forms the corresponding thallium cyclopentadienide, followed by transmetallation with $\left[\mathrm{Rh}\left(\mathrm{C}_{2} \mathrm{H}_{4}\right) \mathrm{Cl}\right]_{2}$. The resulting $\mathrm{Cp}^{\times} \mathrm{Rh}$ (I) complex 1.126, was applied in the enantioselective $\mathrm{C}-\mathrm{H}$ functionalization of hydroxamic acid derivatives 1.127. The reactions were performed under mild reaction conditions and gave the products $\mathbf{1 . 1 3 0}$ in moderate to excellent yields of 59-91\% yield and high enantioselectivities (85:15-97:3 er) (Scheme 1-24b).

## Cramer, 2012

(b) Rh catalyzed enantioselective $\mathrm{C}-\mathrm{H}$ functionalization

Scheme 1-24: Synthesis of $\mathrm{Cp}^{\times}$rhodium catalyst 1.126 and it application in enantioselective $\mathrm{C}-\mathrm{H}$ functionalization.

In 2012, our group reported a second generation of $\mathrm{C}_{2}$-symmetric $\mathrm{Cp}^{\mathrm{x}}$ ligands 1.134 and their application in enantioselective Rh (III)-catalyzed $\mathrm{C}-\mathrm{H}$ allylations of benzamides (Scheme 1-25). ${ }^{62}$ The synthesis of the $\mathrm{Cp}^{\times}$ligand 1.134 a starts from $(R)$-BINOL through intermediate 1.132, which has been used for the synthesis of Maruoka's chiral quaternary ammonium bromide. ${ }^{63}$ From the intermediate 1.132, benzylic bromination and subsequent nucleophilic substitution of sodium cyclopentadienide deliver the desired $\mathrm{C}_{2}$-symmetric biaryl atrop-chiral cyclopentadienyl ligand (Scheme 1-25a). The corresponding $\mathrm{Rh}(\mathrm{I})$ complex 1.137 c successfully catalyzed enantioselective C-H allylations of benzadmies under mild conditions (Scheme 1-25b). The allylated benzamides 1.138 were obtained in moderate to excellent yields of $66-91 \%$ and as well as high enantioselectivities of 82:18 to 99:1 er.

## Cramer, 2013

a) Synthesis of a binaphthyl-derived $\mathrm{Cp}^{\mathrm{x}}$ ligand

b) Enantioselective Rh (III)-catalyzed $\mathrm{C}-\mathrm{H}$ allylations of benzamides

Scheme 1-25: Synthesis of the binaphthyl derived $\mathrm{Cp}^{\mathrm{x}}$ ligands and application in the enantioselective Rh (III)catalyzed $\mathrm{C}-\mathrm{H}$ allylation of benzamides

Like the cyclohexane-fused first generation, the second generation binaphthyl-derived $\mathrm{Cp}^{\mathrm{x}}$ ligands can also be modified. However, their distinctive the modifiability of the side walls for fine-tuning of a corresponding complexes, while leaving the biaryl back wall unchanged (Scheme 1-26). The demethylation of spiro-isomer 1.133a can performed with BuSLi, or in a two-step process consisting of demethylation/silyl protection and silyl deprotection. The two-step demethylation process gave the binaphthol 1.139 in a better yield of $82 \%$ overall. Binaphthol 1.139 can be derivatized by etherification or installation of a triflate followed by cross-coupling. Thermal isomerization transforms spiro compound 1.140 to $\mathrm{Cp}^{\mathrm{x}}$ ligand 1.141 , which is followed by rhodation via a thallium cyclopentadienide intermediate. Screening of different side walls demonstrates their strong influence on enantioselectivity of $\mathrm{C}-\mathrm{H}$ allylations of benzamide (Scheme 1-25b). The enantiomeric ratio varied from 67.5:32.5 to 90:10 depending on the side walls of $\mathrm{Cp}^{\times} \mathrm{Rh}(\mathrm{I})$ complex 1.137. Methanol as a solvent in combination with a bulky triisopropylsilyloxy substituent gave the best result of $90: 10$ er. Only moderate enantioselectivity (67.5:32.5 er), was obtained with hydrogen in the 3 and 3 ' position of the biaryl group (1.137c and 1.137f).

Scheme 1-26: Derivatization of the binaphthyl-derived $\mathrm{Cp}^{\mathrm{x}}$ ligands and complexation with a rhodium precursor.

The binaphthyl-derived $\mathrm{Cp}^{\mathrm{x}}$ ligands are the most successful $\mathrm{Cp}^{\mathrm{x}}$ scaffold thus far. Other transition metals have been applied to that ligand class. For instance, $\mathrm{Cp}^{\times}$Ir(III) was synthesized and utilized for the enantioselective synthesis of fused cyclopropanes by enyne cycloisomerization. ${ }^{64} \mathrm{Cp}^{\times} \mathrm{Ru}$ (II) catalyzed enantioselective Yne-enone cyclization and [2+2] cycloaddition were also investigated. ${ }^{65}$ Recently, $\mathrm{Cp}^{\mathrm{x}}$ ligands were successfully employed for the first time on a 3d-metal, cobalt. $\mathrm{Cp}{ }^{\times} \mathrm{Co}$ complexes were applied in the enantioselective C-H functionalization of $N$-chlorobenzamides. ${ }^{66}$ In addition, Hou and coworkers applied binaphthyl-derived $\mathrm{Cp}^{\mathrm{x}}$ ligands on rare-earth metals such as scandium, ytterbium, gadolinium, samarium, and lanthanum. ${ }^{67}$

The lengthy synthetic route of the binaphthyl derived $\mathrm{Cp}^{\mathrm{x}}$ ligands was improved in 2017 (Scheme $1-27$ ), ${ }^{65 a}$ shortening the synthesis of the ligand carrying with phenyl substituents in position 3 and $3^{\prime}$ positions. The improved synthesis proceeds by Pd-catalyzed ortho-functionalization using the dicarboxylic acid as a directing group. Later on, follow-up investigations extended the method to other and ortho-functionalization of di-carboxylic acid 1.143, broadening scope of derivatization in position 3 - and 3 '- silyl group and halogens. ${ }^{68}$

Cramer, 2017

Scheme 1-27: Refined synthesis of binaphthyl derived $\mathrm{Cp}^{\mathrm{x}}$ ligand with phenyl substituents.

Furthermore, substituents on the Cp ring were installed, leading to penta- and tri-substituted $\mathrm{Cp}^{\mathrm{x}}$ metal complexes (Scheme 1-28). Penta-substituted $C p^{x} 1.147$ is a chiral congener of $\mathrm{Cp}^{*}$. The penta-substituted $C p^{x}$ metal complexes are obtained by $\beta$-carbon elimination of ligand precursors. ${ }^{69}$ The tri-alkyl substituted $\mathrm{Cp}^{\times}$Rh complex $\mathbf{1 . 1 4 8}$ was successfully synthesized and applied in the catalytic $\mathrm{C}-\mathrm{H}$ functionalization of phosphinic amides by kinetic resolutions. ${ }^{70}$ A mild complexation method gives access to tri-substituted $\mathrm{Cp}^{\times}$metal complexes with a silyl group on the Cp ring 1.149. ${ }^{71}$

Scheme 1-28: Penta- and tri-substituted binaphthyl derived $\mathrm{Cp}^{\times}$metal complexes.

In order to streamline ligand synthesis, our group recently reported $\mathrm{Cp}^{\mathrm{x}}$ ligands containing a biphenyl scaffold as a source of axial chirality (Scheme 1-29). ${ }^{68}$ The synthesis starts from the commercially
available carboxylic acid 1.150. ortho-Functionalization with the carboxylic acid as a directing group and ester group installation gives aryl iodide 1.151. Ni-catalyzed Ullmann-type coupling delivers biphenyl 1.152, followed by reduction and conversion of the benzyl alcohol to the corresponding bromide. Nucleophilic substitution of sodium cyclopentadinenide towards the resulting di-benzyl bromide $\mathbf{1 . 1 5 3}$ gives a racemic mixture of both biphenyl derived $\mathrm{Cp}^{\times} \mathbf{1 . 1 5 5}$ and spiro-isomer 1.154. Enantio-pure 1.156 are obtained by preparatory chiral HPLC.

Scheme 1-29: Synthesis of a biphenyl derived $\mathrm{Cp}^{\mathrm{x}}$ ligand.

The You group introduced a novel class of $\mathrm{Cp}^{\mathrm{x}}$ ligands in 2016. ${ }^{72}$ The structures of those $\mathrm{Cp}^{\mathrm{x}}$ ligands are inspired by pioneering work of Zhou and coworkers on 1,1 '-spirobiindane-derived phosphines. ${ }^{73}$ The synthesis starts from the known dicarboxylic acid $\mathbf{1 . 1 5 7}$ (Scheme 1-30). The synthesis of dialkyl chloride $\mathbf{1 . 1 5 8}$ proceeds via ortho-functionalization. Di-alkylation and thermal rearrangement from the spiro-isomer gives 1,1 '-spirobiindane-derived $\mathrm{Cp}^{\mathrm{x}}$ ligand 1.159. The rhodation of the ligand is performed via deprotonation using thallium ethoxide as for the previous cases, ${ }^{61}$ smoothly giving the
corresponding $\mathrm{Cp}^{\times} \mathrm{Rh}(\mathrm{I})$ complexes 1.160 . These were utilized in the enantioselective $\mathrm{C}-\mathrm{H}$ functionalization of biaryl compounds with up to 98:2 er.

Scheme 1-30: Synthesis and application of spirobiindane-derived Cp×Rh complexes.

In 2017, the Waldmann group reported piperidine fused cyclopentadienes, ${ }^{74}$ using an enantioselective $[6+3]$ cycloaddition of imino ester with fulvene as a key step of the synthesis ${ }^{75}$ (Scheme 1-31a). The ligand consists of four modifiable part, and is obtained in three steps from commercially available compounds. However, the lack of $\mathrm{C}_{2}$-symmetry requires a difficult purification of a diastereomeric mixture of rhodium complexes, using an alumina and silica column under inert atmosphere at $-40{ }^{\circ} \mathrm{C}$. Despite that major drawback, the Waldmann group successfully demonstrated the potency of the new ligand class in enantioselective catalysis (Scheme 1-31b). Using rhodium catalyst 1.167a, enantioselective C-H functionalization for the coupling of hydroxamates 1.168 and diazonaphthoquinones 1.169 towards axially chiral biaryl compounds 1.170 proceeded in up to $93 \%$ yield and up to $95: 5 \mathrm{er}$.

b) C-H functionalization of hydroxamates

Scheme 1-31: Synthesis of piperidine fused cyclopentadienes and their application in $\mathrm{C}-\mathrm{H}$ functionalization.

The Perekalin group investigated $\mathrm{Cp}^{\mathrm{x}}$ ligands with planar chirality, allowing facile access to $\mathrm{Cp}^{\times} \mathrm{Rh}$ (III) complexes 1.174 (Scheme 1-32). ${ }^{76}$ They reported a three-step racemic synthesis of $\mathrm{Cp}^{\times} \mathrm{Rh}$ (III) complexes using a $[2+2+1]$ cyclotrimerization of terminal alkynes. The enantiomers were separated by salt formation with (S)-proline and crystallization. The enantiomerically pure $\mathrm{Cp}^{\times} \mathrm{Rh}$ (III) complex $(R)-\mathbf{1 . 1 7 4}$ was employed for the C-H functionalization of aryl hydroxamates in yields up to $97 \%$ and enantioselectivities of up to 88:12-97.5:2.5 er.

Scheme 1-32: Synthesis of planar chiral cyclopentadienyl ligands and the corresponding Rh (III) complexes.

In 2012, Ward and Rovis developed a profoundly different method for creating a chiral environment around $\mathrm{Cp}^{*} \mathrm{Rh}$ (III) complexes and applied them in catalysis (Scheme 1-33). ${ }^{77}$ They created an artificial metalloenzyme containing an active metal species for a catalysis. Biotin was used as a linker for connecting $\mathrm{Cp}^{*} \mathrm{Rh}$ (III) to enzyme. For their initial trial, the experiments were conducted using wild-type streptavidin, which gave only traces of the desired dihydroisoquinolones 1.180. Sitedirected mutagenesis introduced carboxylates close to the Rh(III) center. Installation of a carboxylate in position 121 boosted the catalytic activity of the metalloenzyme. The authors proposed that the carboxylate group facilitates $\mathrm{C}-\mathrm{H}$ activation by concerted metalation-deprotonation (CMD). In addition, they also tuned the enantioselectivity by installing an aromatic amino acid in position 112. The optimized streptavidin and $\mathrm{Cp}^{*} \mathrm{Rh}$ (III) complex with linker 1.176 forms metalloenzyme 1.177, which promoted the C-H functionalization of hydroxamates in up to 93:7 er.

### 1.2.4 Precedents of chiral cyclopentadienyl ruthenium complexes

Several approaches for chiral cyclopentadienyl metal complexes described in Section 1.2.2 have been implemented for ruthenium, for instance the combination with chiral bi-dentate ligands, tethered mono-dentate ligands or $\mathrm{Cp}^{\mathrm{x}}$ ligands This section will introduce representative examples of these types of chiral ruthenium complexes and their application in asymmetric synthesis.

Kündig and co-workers introduced a chiral environment on CpRu complexes by installing a chiral bidentate ligand ( 1.94 in Figure 1-3)..$^{78}$ They applied a previously developed chiral bidentate ligand, biphop-F, on a CpRu complex. ${ }^{22 a}$ The chiral ruthenium complex 1.183 works as a Lewis acid by coordinating to the carbonyl group of enals for catalyzing the enantioselective Diels-Alder reaction of enals with cyclopentadienes, giving the products in high diastereoselectivites of up to $97: 3 \mathrm{dr}$ and enantioselectivities of up to 96:4.

Kündig, 1999

Scheme 1-34: Application of a chiral ruthenium complex with a chiral bidentate ligand.

Bruneau and co-workers reported the first example of enantioselective allylic etherification using $\mathrm{Cp}{ }^{*} \mathrm{Ru}(I I)$ complex with chiral bisoxazoline ligands 1.187 (Scheme 1-35). ${ }^{79}$ They applied bisoxazoline ligands, which is thoroughly investigated chiral bidentate ligands, ${ }^{80}$ to a $\mathrm{Cp}{ }^{*} \mathrm{Ru}(\mathrm{II})$ complex. This catalytic system delivered the substituted allyl aryl ether with a preference to branched one. In addition, it showed high enantioselectivity of $\mathbf{1 . 1 8 8}$ up to $91: 9$ er.

Scheme 1-35: Enantioselective allylic etherification with chiral Ru(II) bisoxazoline complexes.

Another class of chiral CpRu (II) complexes uses a ligand with point chirality tethered to a cyclopentadiene ring ( 1.95 in Figure 1-3). Takahashi's planar chiral CpRu(II) complex was reported in 2000, and one year later, the group demonstrated its application in an asymmetric allylic alkylation (Scheme 1-36). ${ }^{54}$ Acyl chloride formation was followed by nucleophilic acyl substitution. The resulting ester was submitted to UV light with acetonitrile as a solvent for substitution on the arene ligand, giving planar chiral CpRu complex 1.192 with two vacant coordination sites. Even though the scope of the reaction was limited, it proceeded in excellent yields of 1.196 up to $98 \%$, and enantiomeric ratios up to 98.5:1.5.

Takahashi, 2000, 2001
a) Synthesis of chiral $\mathrm{CpRu}(I I)$ using a tethered ligand

b) Aymmetric allylic alkylation using the chiral $\mathrm{CpRu}(\mathrm{II})$ catalyst

Scheme 1-36: Synthesis of chiral $\mathrm{CpRu}(\mathrm{II})$ complexes carrying a tethered ligand and their application in asymmetric allylic alkylation.

A similar example employs a tethered ligand with point chirality instead of planar chirality ( 1.95 in Figure 1-3). The Trost group employed the point chirality of a sulfoxide tethered to a cyclopentadienyl group (Scheme 1-37). ${ }^{55}[3+2]$ cycloaddition between $\left[\left(\eta^{3}\right.\right.$-allyl) RuCl $\left.\left(\mathrm{C}_{6} \mathrm{H}_{6}\right)\right] 1.197$ and unsymmetrical alkyne 1.198 constructed the cyclopentadienyl ligand. Subsequent de-silylation, counter anion exchange and arene ligand substitution under UV light resulted in the chiral CpRu(II) complex 1.200. The branched-selective asymmetric allylic substation was catalyzed by the chiral $\mathrm{CpRu}(\mathrm{II})$ complex 1.200, proceeding with high enantioselectivities (up to $96.5: 3.5 \mathrm{er}$ ) on a broad scope of substrates.

Trost, 2013
a) Synthesis of chiral $\mathrm{CpRu}(I I) 1.200$ using a tethered sulfoxide ligand

b) Aymmetric allylic substition using chiral CpRu (II) catalyst $\mathbf{1 . 2 0 0}$

Scheme 1-37: Synthesis of chiral CpRu (II) 1.200 using a tethered sulfoxide and its application in asymmetric allylic substitution.

Our group applied binaphthyl-derived $\mathrm{Cp}^{\mathrm{x}}$ ligands to ruthenium for the first time in 2015 (1.96 in Figure 1-3), ${ }^{65 c}$ establishing a ruthenation method for $\mathrm{Cp}^{\mathrm{x}}$ ligands (Scheme 1-38a). Deprotonation of binaphthyl-derived $C p^{x}$ ligands 1.205 by thallium ethoxide and subsequent complexation with $\left[\left(\mathrm{C}_{6} \mathrm{H}_{6}\right) \mathrm{RuCl}_{2}\right]_{2}$ delivers $\mathrm{Cp}^{\times} \mathrm{Ru}$ (arene) complexes Ru.1a. A subsequent counteranion exchange with silver hexafluorophosphate and light-mediated removal of the benzene ligand gives the active CpRu(II) complexes Ru.2b. These active $C p^{\times} R u(I I)$ complexes successfully catalyze an enantioselective yne-enone cyclization, providing 4H-pyrans 1.207 with high enantiomeric ratios up to 99:1 (Scheme 1-38b). Later, the binaphthyl-derived $\mathrm{Cp}^{\times} \mathrm{Ru}$ (II) complexes were adapted for enantioselective $[2+2]$ cycloadditions of internal alkynes and norbornadienes. ${ }^{65 a, b}$

### 1.3 Aims of the thesis

The versatile reactivity of ruthenium, the least expensive platinum group metal, has been actively investigated since the 1980s. ${ }^{4}$ As new reactivities were discovered, the desire for enantioselective transformations in ruthenium catalysis emerged. In this context, the power of $\mathrm{Cp}^{\mathrm{x}}$ ligands for realizing enantioselective transformations has been demonstrated successfully. ${ }^{56}$ However, the development of concise syntheses of chiral Cp ligands and their exploitation for enantioselective transition-metal catalyzed reactions remains in its early stages. The first goal of this thesis was to develop streamlined synthetic routes to new $\mathrm{Cp}^{\mathrm{x}}$ ligands and their corresponding cationic and neutral $\mathrm{Cp}^{\times} \mathrm{Ru}$ (II) complexes (Figure 1-4a). The second goal was the exploitation of their potential in asymmetric catalysis (Figure 1-4b). Three different enantioselective transformations will be discussed, showcasing the versatile reactivity of $\mathrm{Cp}^{\times} \mathrm{Ru}(\mathrm{II})$ complexes and their high capability for enantio-induction.

Chapter 2 Synthesis of Chiral Cp ${ }^{\mathrm{x}}$ Ligands and Cp×Ru (II) Complexes

### 2.1 Cyclopentane Fused Cp× Ligands

### 2.1.1 Ligand Synthesis and Complexation

The first class of $C p^{x}$ ligands, cyclohexane-fused $C p^{x}$, is accessible by a concise synthetic route. In spite of that, there is a drawback of the cyclohexane-fused $\mathrm{Cp}^{\mathrm{x}}$. As the side walls are difficult to modify, optimizing a reaction for high enantioselectivity is tricky. The $\mathrm{C}_{2}$-symmetric atropchiral binaphthyl-derived $\mathrm{Cp}^{\mathrm{x}}$ ligands has proved its synthetic utility in a variety of asymmetric reactions. ${ }^{62,}$ ${ }^{64-66}$ However, the lengthy synthesis of the atropchiral binaphthyl-derived ligands gave rise to the desire for a novel chiral $\mathrm{Cp}^{\mathrm{x}}$, combining the advantages of the first two generations: modifiable side walls and concise synthetic access.

The synthesis of the cyclopentane-fused $\mathrm{Cp}^{\mathrm{x}}$ ligands was inspired by the enantioselective enereaction of cyclopentadiene. ${ }^{81}$ The organocatalyzed ene-type reaction of cinnamaldehyde 2.1 and cyclopentadiene 2.2 followed by condensation gives the chiral cyclopentane-fused fulvene 2.5 with excellent enantioselectivity (98.5:1.5 er) (Scheme 2-1).

Scheme 2-1: Synthesis of chiral cyclopentane-fused fulvenes.

A subsequent diastereoselective addition of an aryl lithium 2.6 gives cyclopentane-fused chiral cyclopentadiene 2.7. The metalation of the cyclopentane-fused chiral cyclopentadiene was performed by an established procedure for CpRu complexes. ${ }^{65 \mathrm{c}}$ Metalation with thallium ethoxide generated the corresponding $\mathrm{C}_{2}$-symmetric chiral cyclopentadienide and subsequent transmetalation with ruthenium resulted in a $96 \%$ yield of $\mathrm{Cp}^{\times} \mathrm{Ru}\left(\mathrm{C}_{6} \mathrm{H}_{6}\right) \mathrm{Cl}$ Ru.3aa. Anion exchange with silver hexafluorophosphate brought $\mathrm{Cp}^{\times} \mathrm{Ru}\left(\mathrm{C}_{6} \mathrm{H}_{6}\right) \mathrm{PF}_{6}$ Ru.3ba, and precipitation of silver chloride (Scheme 2-2).

Scheme 2-2: Synthesis of cyclopentane fused $\mathrm{Cp}^{\mathrm{x}}$ ligand and complexation of the ligand.

As the benzene ruthenium complex Ru.3ba is inert, the benzene ligand was then removed from the complex. UV-facilitated ligand exchange to acetonitrile accompanied by removal of benzene ligand was performed ${ }^{65 c, 82}$ to introduce labile ligands. The acetonitrile ligands readily dissociate to generate the catalytically active coordinatively unsaturated species. After the photoreaction, all volatile compounds were evaporated under high vacuum. Due to the high affinity of the desired ruthenium complex Ru.4ba to acetonitrile, freeze-drying was performed to removing any residual solvent. This photoreaction produced the desired trisacetonitrile complex Ru.4ba in a near-quantitative yield of 99\% yield (Scheme 2-3).

Scheme 2-3: UV light facilitated removal of an arene ligand.

### 2.1.2 Aryl Group Derivatives

With a synthetic route to the cyclopentane-fused $\mathrm{Cp}^{\mathrm{x}}$ ligands in hand, a ligand library carrying different side walls was generated. The established method for anion exchange gave the corresponding $\mathrm{Cp}^{\times} \mathrm{Ru}\left(\mathrm{C}_{6} \mathrm{H}_{6}\right) \mathrm{PF}_{6}$ complexes (Ru.3b) (Scheme 2-4). The complexes carrying orthoand para-substituted aryl groups were obtained in good to excellent yields of 77-96\% (Table 2-1, Ru.3b). The complex with substituents in both of meta-positions was acquired in a moderate yield of $53 \%$ (Table 2-1, Ru.3bg). However, the complexes carrying 1-naphthyl or 2-naphthyl substituents formed an insoluble sticky solid during the anion exchange step and could not be isolated (Table 2-1, Ru.3bh and Ru.3bi).

Scheme 2-4: Anion exchange and active complex formation of a library of cyclopentane-fused third generation $\mathrm{Cp}^{\times} \mathrm{Ru}$ complexes.

The active complex preparation by removal of an arene ligand worked smoothly (Scheme 2-5). Regardless of substituents positions on aryl rings, all the cases resulted in high yield, $90 \%$ to quantitative conversion. (Table 2-1, Ru.4b).

## Ru.3bi

Conditions for counter anion exchange: 1.2 equiv. of silver hexafluorophosphate, 0.2 M in DCM, 15 min .; Conditions for removal of arene ligand: UV light, $15^{\circ} \mathrm{C}, 0.02 \mathrm{M}$ in $\mathrm{CH}_{3} \mathrm{CN}$; [a] Data from Dr. Shou-Guo Wang; [b] Data from Dr. David Kossler, and the $\mathrm{Cp}^{\times}$ligand of Ru.3bg has the opposite absolute stereochemistry.

The crystal structures of Ru.3ba and Ru.3bc were revealed by X-ray diffraction spectroscopy. As expected, one of the phenyl group is placed above the plane of the cyclopentane ring, the other phenyl group is positioned below the cyclopentane ring and shields one side of the ruthenium center (Figure 2-1). The distance between ruthenium and the meta-carbon atom of the aryl group ( $\mathrm{d}_{\text {Rut-C17 }}$ ) is $4.94 \AA$. The dihedral angle between cyclohexane ring and aryl group ( $\theta_{\text {c5-c6-C15-C16 }}$ ) is $37.3^{\circ}$.

Ru.3ba

C17

Figure 2-1: X-ray crystal structure of Ru.3ba. For clarity, hydrogen atoms are omitted.

Introduction of 2-methoxy substituents in the aryl group on the $\mathrm{Cp}^{\mathrm{x}}$ ligand causes slight structural changes on the ruthenium complex Ru.3bc (Figure 2-2). The distance between ruthenium and the meta-carbon atom ( $\mathrm{d}_{\mathrm{Ru} 1-\mathrm{Cl1}}$ ) is increased to $5.42 \AA$. The change originates from a rotation of the aryl group along the carbon-carbon bond (C1-C9). As a result, the dihedral angle ( $\theta$ c8-c1-c9-c10) increases from 37.3 to $64.8^{\circ}$ compared to phenyl-substituted Ru.3ba.

Figure 2-2: X-ray crystal structure of Ru.3bc.

### 2.1.3 Synthesis of Neutral Complexes

Kirchner and coworkers reported the synthesis of $\mathrm{CpRu}(\mathrm{COD})\left(\mathrm{CH}_{3} \mathrm{CN}\right)$ complex 2.9 by ligand exchange of $\mathrm{CpRu}\left(\mathrm{CH}_{3} \mathrm{CN}\right)_{3} \mathrm{PF}_{6} 2.8$ (Scheme 2-6). ${ }^{83}$ In an analogous manner, a solution of $\mathrm{CpRu}\left(\mathrm{CH}_{3} \mathrm{CN}_{3} \mathrm{PF}_{6}\right.$ in dichloromethane was stirred with an excess amount of cyclooctadiene (COD) at room temperature, smoothly delivering $\mathrm{CpRu}(\mathrm{COD})\left(\mathrm{CH}_{3} \mathrm{CN}\right)$ in $97 \%$ yield.

Kirchner, 1999

Scheme 2-6: $\mathrm{CpRu}(\mathrm{COD})\left(\mathrm{CH}_{3} \mathrm{CN}\right)$ complex synthesis by ligand exchange from $\mathrm{CpRu}\left(\mathrm{CH}_{3} \mathrm{CN}\right)_{3} \mathrm{PF} 6$.

Using similar conditions, Kudinov accessed neutral $\mathrm{CpRuL}_{2} \mathrm{X}$ complexes ( $\mathrm{L}=$ mono- and diphosphine, dienyl, carbonyl) by substitution of the naphthalene ligand on cationic $\mathrm{CpRu}\left(\mathrm{C}_{10} \mathrm{H}_{8}\right)^{+}$ complex 2.10 by a halide and cyclooctadiene under mild conditions. ${ }^{84}$

Scheme 2-7: $\mathrm{CpRu}(\mathrm{COD}) \mathrm{X}$ synthesis by substitution on a $\mathrm{CpRu}\left(\mathrm{C}_{10} \mathrm{H}_{8}\right) \mathrm{BF}_{4}$ complex

The analogous norbornadiene complexes 2.12 were obtained in moderate to very good yields by reaction of $\mathbf{2 . 1 0}$ under the same reaction conditions from (Scheme 2-8). Reaction with chloride or bromide gave better yields than iodide for both diene ligands.

Scheme 2-8: $\mathrm{CpRu}(\mathrm{NBD}) X 2.12$ synthesis by substitution in a $\mathrm{CpRu}\left(\mathrm{C}_{10} \mathrm{H}_{8}\right) \mathrm{BF}_{4}$ complex 2.10.

Reaction of $\mathrm{Cp}^{\times} \mathrm{Ru}\left(\mathrm{CH}_{3} \mathrm{CN}\right)_{3} \mathrm{PF}_{6}$ Ru.4ba with cyclooctadiene and tributylammonium iodide did not give the desired product Ru.5a (Scheme 2-9). After the reaction, major compounds in the crude mixture was free COD and tetrabutylammonium iodide. Decomposition occurred instead of ligand substitution.

Scheme 2-9: Neutral $C p^{\times} R u(C O D) ।$ Ru.5a synthesis by substitution in $\mathrm{Cp}^{\times} \mathrm{Ru}\left(\mathrm{CH}_{3} \mathrm{CN}\right)_{3} \mathrm{PF}_{6}$ Ru.4ba.

In contrast to the reaction with 1,5-cyclooctadiene, ligand substitution to norbornadiene delivered the desired neutral CpRu(NBD)X complexes Ru.6a and Ru.6b (Scheme 2-10), which were, to our surprise, stable on silica. After purification by silica column chromatography, $\mathrm{Cp} \times \mathrm{Ru}(\mathrm{NBD}) \mathrm{X}$ complexes Ru.6a and Ru.6b were isolated in 47 and 15\% yield, respectively.

Scheme 2-10: Neutral Cp×Ru(NBD)X (Ru.6a and Ru.6b) synthesis by substitution in $\mathrm{Cp}^{\times} \mathrm{Ru}\left(\mathrm{CH}_{3} \mathrm{CN}\right)_{3} \mathrm{PF}_{6}$ Ru.4ba.

### 2.2 Synthesis of Atropchiral Binaphthyl-Derived $\mathrm{Cp}^{\mathrm{x}}$ Ligands

The synthesis of binaphthyl-derived $\mathrm{Cp} \times \mathrm{Ru}(\mathrm{II})$ complexes has been previously established in our group. ${ }^{65 c}$ By following the known procedure, ruthenium complexes with different side wall were accessed (Table 2-2). Thallium ethoxide deprotonates the respective $\mathrm{Cp}^{\times}$ligand 2.13 and forms a thallium cyclopentadienide ( $\mathrm{TICp}{ }^{x}$ ), followed by complexation with $\left[\mathrm{Ru}\left(\mathrm{C}_{6} \mathrm{H}_{6}\right) \mathrm{Cl}_{2}\right]_{2}$ 2.14. The desired
$\mathrm{Cp}{ }^{\times} \mathrm{Ru}\left(\mathrm{C}_{6} \mathrm{H}_{6}\right) \mathrm{Cl}$ complexes Ru.1a were obtained in $7-35 \%$ yield. The corresponding mono-silylated products Ru.7a were observed as side products in 5-14\% yield.

Table 2-2: Complexation of second generation $\mathrm{Cp}^{\times}$ligands.

Conditions: [a] $\mathrm{Cp}^{\mathrm{x}}$ ligand and 1.1 equiv. of thallium ethoxide were stirred at $80^{\circ} \mathrm{C}$ for 3 hr , then mixed and stirred with $\left[\mathrm{Ru}\left(\mathrm{C}_{6} \mathrm{H}_{6}\right) \mathrm{Cl}_{2}\right]_{2}$ at room temperature; $[\mathrm{b}] \mathrm{Cp}^{\times}$ligand and 1.1 equiv. of thallium ethoxide were stirred at room temperature for 13 hr ; [c] Stirred with a $\mathrm{Cp}^{\mathrm{x}}$ ligand and 3.0 equiv. of thallium ethoxide at room temperature for 13 hr .

Counteranion exchange on the $\left[\mathrm{Cp} \times \mathrm{Ru}\left(\mathrm{C}_{6} \mathrm{H}_{6}\right)\right] \mathrm{Cl}$ complexes Ru.1ab and Ru.1ac with silver hexafluorophosphate, gave the corresponding hexafluorophosphate complexes [Cp×Ru( $\left.\left.\mathrm{C}_{6} \mathrm{H}_{6}\right)\right] \mathrm{PF}_{6}$ Ru.1bb and Ru.1bc (Scheme 2-11).

Scheme 2-11: Counteranion exchange on binaphthyl-derived $\mathrm{Cp}^{\times}$ruthenium complexes.

As the cases of previously reported binaphthyl-derived $\mathrm{Cp}^{\times} R u\left(\mathrm{C}_{6} \mathrm{H}_{6}\right) \mathrm{PF}_{6}$ complexes Ru.1b ${ }^{65 c}$ and cyclopentane-fused $\mathrm{Cp}^{\times} \mathrm{Ru}\left(\mathrm{C}_{6} \mathrm{H}_{6}\right) \mathrm{PF}_{6}$ complexes Ru.3b, $\mathrm{Cp}^{\times} \mathrm{Ru}\left(\mathrm{CH}_{3} \mathrm{CN}\right)_{3} \mathrm{PF}_{6}$ Ru.2bb and Ru.2bc were synthesized in good yield, 79-83\% (Scheme 2-12).

Scheme 2-12: UV-light facilitated removal of benzene ligands from binaphthyl-derived $\mathrm{Cp}^{\times} \mathrm{Ru}$ complexes.

In order to improve the efficiency of the synthetic route towards $\left[\mathrm{Cp}^{\mathrm{x}} \mathrm{Ru}\left(\mathrm{C}_{6} \mathrm{H}_{6}\right)\right] \mathrm{PF}_{6}$, late-stage modification of the ruthenium complexes was investigated. Previously, the $\mathrm{Cp}^{\mathrm{x}}$ ligand had to be derivatized before complexation with ruthenium. We envisioned a derivatization of the sidewall of the $\mathrm{Cp}^{\mathrm{x}}$ ligand on $\left[\mathrm{Cp}^{\mathrm{x} R u}\left(\mathrm{C}_{6} \mathrm{H}_{6}\right)\right] \mathrm{PF}_{6}$. Initial fluoride-mediated TIPS-deprotection of the OH group of Ru.1bc by fluoride smoothly gave Ru.1be in a near-quantitative yield (Scheme 2-13).

Scheme 2-13: De-silylation of Ru.1bc

The desilylated complex Ru.1be was submitted to various silyl protecting conditions (Scheme 2-14). However, starting material Ru.1be was recovered, or decomposition happened with traces of disilylated product Ru.1bd and mono-silylated product Ru.7bd.

Scheme 2-14: Silyl protection on Ru.1be.

As an alternative, Mitsunobu type conditions for silyl protection were also evaluated on Ru.1be. However, the starting material Ru.1be was recovered with no trace of desired product (Scheme 2-15). Overall all, the trials for streamlining the synthetic route by late-stage modification of sidewall on $\left[\mathrm{Cp} \times \mathrm{Ru}\left(\mathrm{C}_{6} \mathrm{H}_{6}\right)\right] \mathrm{PF}_{6}$ were not successful.

Scheme 2-15: Silyl protection using Mitsunobu type condition.

Chapter 3 Enantioselective Ruthenium(II)Catalyzed Synthesis of Benzonorcaradienes

### 3.1 Introduction

Tricyclic sesquiterpenes comprise a large chemical family, which is continuously expanding as a result of their frequent occurrence in various terrestrial and marine natural products. ${ }^{85}$ Among them, chemicals containing benzonorcaradiene and benzonorcarene moieties possess biological activities and applications in broad areas, such as antibiotics, ${ }^{86}$ neuropathic pain disorder, ${ }^{87}$ osteoarthritis, ${ }^{88}$ immune disorder, ${ }^{89}$ and breast cancer. ${ }^{90}$

metalloproteinase-13 inhibitor $\left(\mathrm{IC}_{50}<100 \mathrm{nM}\right)$

Figure 3-1: Benzonorcaradiene and benzonorcarene moieties in a natural product and pharmaceutical compounds

Despite their high potential for pharmaceutical applications, the synthesis of benzonorcaradienes still leaves much room for improvement as it is highly reliant on the cyclopropanation of naphthalenes using carbenes or carbenoids. ${ }^{91}$ The first example was reported by Buchner in 1903 (Scheme 3-1).

Scheme 3-1: First reported example of benzonorcaradiene synthesis using a carbene

A recent example used a hypervalent iodonium alkynyl triflate 3.4 and an azide 3.6, which forms phenylcyanocarbene 3.7 in situ, for the cyclopropanation of naphthalene (Scheme 3-2).

Croatt, 2017

59\% (10:1 ratio of 3.8:3.9)
(stereochemistry not known)

Scheme 3-2: Recent example of benzonorcaradiene synthesis using a carbene

Other isolated examples for accessing benzonorcaradiene have been reported, ${ }^{92,93}$ such as goldcatalyzed transformations. ${ }^{94}$

In 2011, Tenaglia and coworkers reported a ruthenium-catalyzed synthesis of benzonorcaradienes that does not involve carbenoids. ${ }^{95}$ The transformation is a coupling of oxa-benznorbornadienes $\mathbf{3 . 1 0}$ and alkynes 3.11, yielding a benzonorcaradiene 3.12 in a single step.

Tenaglia, 2011

3.10

3.11

3.12

Scheme 3-3: Ruthenium catalyzed coupling of oxa-benzonorbornadienes and alkynes

The enantioselective synthesis of benzonorcaradiene remains an underdeveloped field, despite its high potential for utilization in pharmaceutical applications. To the best of our knowledge, few enantioselective syntheses of norcaradienes or cycloheptatrienes by cyclopropanation of arenes have been reported. ${ }^{96}$ Among them, only a single report studied an intermolecular transformation. ${ }^{97}$ In addition, two reports describe the enantioselective synthesis of benzonorcaradienes. ${ }^{98}$ Only one of them is an intermolecular transformation, which proceeds via rhodium catalyzed asymmetric ringopening/cyclopropanation. ${ }^{98 b}$

### 3.2 Optimization Studies for Benzonorcaradiene Synthesis

For initial optimization of the reaction conditions, oxa-benzonorbornadiene 3.13a and di-propargylic alcohol 3.14a (Table 3-1) were employed as a model system. The cyclohexane-fused $\mathrm{Cp}^{\mathrm{x}}$ complex Ru.8ba gave the desired product in moderate yield $27 \%$ with moderate enantioselectivity (82.5:17.5 er) (Entry 1). Binaphthyl-derived $\mathrm{Cp}^{\mathrm{x}}$ ruthenium complex Ru.2ba showed a similar reactivity, but the enantioselectivity decreased substantially to 69.5:30.5 er (Entry 2). Binaphthyl-derived $\mathrm{Cp}^{\times} \mathrm{Ru}$ (II) complexes Ru.2bf and Ru.2bc with bulkier sidewalls did not improve enantioselectivity (Entry 3 and 4). Significant improvement on enantioselectivity and reactivity was observed upon the adoption of cyclopentane-fused $\mathrm{Cp}^{\mathrm{x}}$ complex Ru.4ba (Entry 5), resulting in good enantioselectivity (85.5:14.5 er). This result was used as a starting point for further optimization studies.

Table 3-1: Ligand screening.

Conditions: $28 \mu \mathrm{~mol}$ of $\mathbf{3 . 1 3 a}$, $28 \mu \mathrm{~mol}$ of $\mathbf{3 . 1 4 a}, 1.4 \mu \mathrm{~mol}$ of [Ru], $9.7 \mu \mathrm{~mol}$ of $\mathrm{Mel}, 2.8 \mu \mathrm{~mol}$ of $\mathrm{PPh}_{3}, 0.125 \mathrm{M}$ in solvent, 18 h ; Yields and conversions of oxa-benzonorbornadiene 3.13 a were determined by ${ }^{1} \mathrm{H}$ NMR with $\mathrm{CH}_{2} \mathrm{Br}_{2}$ as internal standard; A single diastereomer was observed; enantiomeric ratio was determined by HPLC with a chiral stationary phase.

As a next step, different aryl substituents on the cyclopentane-fused $\mathrm{Cp}^{\mathrm{x}}$ ligand were evaluated. In general, only a minor influence on both yield and enantioselectivity was observed (Table 3-2), with yields in a narrow range of (53-63\%) and an almost unchanged enantioselectivity for 2- or 4-alkyl aryl (Entry 2 and 3 ). However, changing to a 2-methoxy substituted aryl group resulted in a slight decrease in enantioselectivity, 82:18 er (Entry 4), while a 4-methoxy aryl substituent gave similar results to phenyl and 2-tolyl (Entry 5). Biphenyl substituents and 3,5-dimethyl aryl substituents caused a slight decrease in enantioselectivity to ca. 81:19 er (Entry 6 and 7).

Table 3-2: Ligand substituent screening.

| Entry | Substituent (R) | Conversion [\%] | Yield [\%] | er |
| :--- | :--- | :--- | :--- | :--- |
| 1 | $\mathrm{C}_{6} \mathrm{H}_{4}$ | 100 | 59 | $85.5: 14.5$ |
| 2 | $2-\mathrm{Me}_{6} \mathrm{H}_{4}$ | 100 | 63 | $85.5: 14.5$ |
| 3 | $4-\mathrm{Pr}_{6} \mathrm{C}_{6} \mathrm{H}_{4}$ | 100 | 62 | $84.5: 15.5$ |
| 4 | $2-\mathrm{MeO}-\mathrm{C}_{6} \mathrm{H}_{4}$ | 100 | 57 | $82: 18$ |
| 5 | $4-\mathrm{MeO}-\mathrm{C}_{6} \mathrm{H}_{4}$ | 100 | 63 | $86.5: 13.5$ |
| 6 | biphenyl | 100 | 65 | $81: 19$ |
| 7 | $3,5-\mathrm{Me}_{2}-\mathrm{C}_{6} \mathrm{H}_{3}{ }^{\mathrm{a}}$ | 100 | 53 | $19.5: 80.5$ |

Conditions: $28 \mu \mathrm{~mol}$ of $\mathbf{3 . 1 3 a}$, $28 \mu \mathrm{~mol}$ of $\mathbf{3 . 1 4 a}, 1.4 \mu \mathrm{~mol}$ of [Ru], $9.7 \mu \mathrm{~mol}$ of $\mathrm{Mel}, 2.8 \mu \mathrm{~mol}$ of $\mathrm{PPh}_{3}, 0.125 \mathrm{M}$ in solvent, 18 h ; Yields and conversions of oxa-benzonorbornadiene 3.13 a were determined by ${ }^{1} \mathrm{H}$ NMR with $\mathrm{CH}_{2} \mathrm{Br}_{2}$ as internal standard; A single diastereomer was observed; enantiomeric ratio was determined by HPLC with a chiral stationary phase. [a] Opposite absolute stereochemistry of the catalyst.

Subsequently, solvent screening was conducted, evaluating with aromatic, chlorinated, polar aprotic, and polar protic solvents (Table 3-3). Acetone gave the best balance between yield and enantioselectivity ( $59 \%$ yield, $85.5: 14.5$ er) (Entry 1). 2-Butanone, which has similar properties to acetone but with a higher boiling point, resulted in virtually the same results (57\%, 84:16 er) (Entry 2). Benzene, representative for aromatic solvents, had an adverse effect on both yield and enantioselectivity (Entry 3). Dioxane, which was used for the racemic version of the reaction, and tetrahydrofuran resulted in a loss of enantioselectivity (Entry 4 and 5). As examples of chlorinated solvents, dichloromethane and dichloroethane were also evaluated (Entry 6 and 7).

Dichloromethane gave a similar result to acetone ( $62 \%$ yield, $85: 15 \mathrm{er}$ ), while dichloroethane led to a slight loss in both of yield and enantioselectivity ( $55 \%$, 82.5:17.5 er). Polar aprotic solvents that can coordinate to ruthenium induced similar or improved enantioselectivity, but accompanied by a considerable decrease in yield to ca. 15\% (Entry 8 and 9). Alcoholic solvents increased enantioselectivity to ca. 85:15 er, but had an adverse effect on the yield (27-40\% yield) (Entry 1012)

Table 3-3: Solvent screening.

| Entry | Solvent | Conversion [\%] | Yield [\%] | er |
| :--- | :--- | :--- | :--- | :--- |
| 1 | acetone | 100 | 59 | $85.5: 14.5$ |
| 2 | 2-butanone | 100 | 57 | $84: 16$ |
| 3 | benzene | 95 | 47 | $81.5: 18.5$ |
| 4 | dioxane | 100 | 63 | $79: 21$ |
| 5 | THF | 100 | 55 | $80: 20$ |
| 6 | DCM | 100 | 62 | $85: 15$ |
| 7 | DCE | 100 | 55 | $82.5: 17.5$ |
| 8 | DMF | 68 | 14 | $89.5: 10.5$ |
| 9 | acetonitrile | 78 | 16 | $83: 17$ |
| 10 | tBuOH | 77 | 27 | $82: 18$ |
| 11 | IPOH | 92 | 40 | $87.5: 12.5$ |
| 12 | EtOH | 97 | 36 | $88.5: 11.5$ |

Conditions: $28 \mu \mathrm{~mol}$ of $3.13 \mathrm{a}, 28 \mu \mathrm{~mol}$ of $3.14 \mathrm{a}, 1.4 \mu \mathrm{~mol}$ of Ru.4ba, $9.7 \mu \mathrm{~mol}$ of Mel, $2.8 \mu \mathrm{~mol}$ of $\mathrm{PPh}_{3}, 0.125$ M in solvent, 18 h ; Yields and conversions of oxa-benzonorbornadiene 3.13a were determined by ${ }^{1} \mathrm{H}$ NMR with $\mathrm{CH}_{2} \mathrm{Br}_{2}$ as internal standard; A single diastereomer was observed; enantiomeric ratio was determined by HPLC with a chiral stationary phase.

Temperature screening showed that the reaction temperature affected both enantioselectivity and yield of the reaction (Table 3-4). With acetone as solvent, $60^{\circ} \mathrm{C}$ was the optimal temperature in
terms of yield. However, a higher enantioselectivity was obtained with higher reaction temperatures. (Entry 1-3). In order to run the reaction at higher temperatures, 2-butanone and 3-pentanone, congeners of acetone with higher boiling points, were used. For 2 -butanone, $80^{\circ} \mathrm{C}$ was the best reaction temperature, resulting in a slightly improved enantiomeric ratio (89.5:10.5) and yield (61\%) compared to the reaction in acetone at $60^{\circ} \mathrm{C}$ (Entry 4-6). The reactions were also conducted in 3pentanone. Temperatures above $80^{\circ} \mathrm{C}$ had a detrimental effect on yield (Entry 7-9).

Table 3-4: Solvent and temperature screening.

| Entry | Temperature | Solvent | Conversion [\%] | Yield [\%] | er |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 1 | 40 |  | 96 | 42 | $73.5: 26.5$ |
| 2 | 60 | acetone | 100 | 59 | $85.5: 14.5$ |
| 3 | 80 |  | 57 | 27 | $90: 10$ |
| 4 | 60 |  | 100 | 57 | $84: 16$ |
| 5 | 80 | 2-butanone | 100 | 61 | $89.5: 10.5$ |
| 6 | 100 |  | 100 | 59 | $89.5: 10.5$ |
| 7 | 80 |  | 100 | 63 | $87.5: 12.5$ |
| 8 | 100 | 3-pentanone | 100 | 59 | $91.5: 8.5$ |
| 9 | 120 |  | 100 | 37 | $90.5: 9.5$ |

Conditions: $28 \mu \mathrm{~mol}$ of 3.13a, $28 \mu \mathrm{~mol}$ of 3.14a, $1.4 \mu \mathrm{~mol}$ of Ru.4ba, $9.7 \mu \mathrm{~mol}$ of $\mathrm{Mel}, 2.8 \mu \mathrm{~mol}$ of $\mathrm{PPh}_{3}, 0.125$ M in solvent; Yields and conversions of oxa-benzonorbornadiene 3.13a were determined by ${ }^{1} \mathrm{H}$ NMR with $\mathrm{CH}_{2} \mathrm{Br}_{2}$ as internal standard; A single diastereomer was observed; enantiomeric ratio was determined by HPLC with a chiral stationary phase.

The effect of amine bases were evaluated (Table 3-5). DMAP and pyridine improved enantioselectivity up to 97.5:2.5 er, but decreasing the yield (Entry 2 and 3). DBU only made marginal change in terms of yield without effect on enantioselectivity (Entry 4).

Table 3-5: Screening of amine base.

| Entry | Amine | Conversion [\%] | Yield [\%] | er |
| :--- | :--- | :--- | :--- | :--- |
| 1 | none | 100 | 61 | $89.5: 10.5$ |
| 2 | DMAP | 45 | 12 | $95: 5$ |
| 3 | Pyridine | 76 | 36 | $\mathbf{9 7 . 5 : 2 . 5}$ |
| 4 | DBU | 100 | 58 | $89.5: 10.5$ |

Conditions: $28 \mu \mathrm{~mol}$ of $\mathbf{3 . 1 3 a}, 28 \mu \mathrm{~mol}$ of $\mathbf{3 . 1 4 a}, 1.4 \mu \mathrm{~mol}$ of Ru.4ba, $9.7 \mu \mathrm{~mol}$ of Mel, $2.8 \mu \mathrm{~mol}$ of $\mathrm{PPh}_{3}, 11$ $\mu \mathrm{mol}$ of amine, 0.125 M in solvent; Yields and conversions of oxa-benzonorbornadiene 3.13a were determined by ${ }^{1} \mathrm{H}$ NMR with $\mathrm{CH}_{2} \mathrm{Br}_{2}$ as internal standard; A single diastereomer was observed; enantiomeric ratio was determined by HPLC with a chiral stationary phase.

Because pyridine and 4-dimethylaminopyridine boosted enantioselectivity, further screening with pyridine derivatives was conducted (Table 3-6). All evaluated pyridine derivatives substantially increased enantioselectivity to ca. 97:3 er. Compared with the addition of pyridine, o-substituted pyridines improved the yield to about $50 \%$ with nearly the same enantioselectivity (up to 97.5:2.5 er (Entry 3-5). In contrast, 2-substituted or 4-substituted pyridine derivatives decreased the yield, even though the enantioselectivity was constantly high (Entry 6 and 7). Neutral ruthenium complex Ru.6a was also evaluated (Entry 8). It gave virtually the same enantioselectivity (96.5:3.5 er), as the cationic complex Ru.4ba, but did not give any improvement in yield.

Table 3-6: Screening of pyridine derivatives.

| Entry | Ru cat. | Amine | Conversion [\%] | Yield [\%] | er |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 1 | Ru.4ba | none | 100 | 61 | $89.5: 10.5$ |
| 2 | Ru.4ba | pyridine | 76 | 36 | $97.5: 2.5$ |
| 3 | Ru.4ba | 2,6-lutidine | 100 | 50 | $97: 3$ |
| 4 | Ru.4ba | 2-methylpyridine | 97 | 47 | $97.5: 2.5$ |
| 5 | Ru.4ba | 2-isopropylpyridine | 95 | 48 | $96.5: 3.5$ |
| 6 | Ru.4ba | 3-methylpyridine | 66 | 29 | $96.5: 3.5$ |
| 7 | Ru.4ba | 4-methylpyridine | 55 | 22 | $96.5: 3.5$ |
| 8 | Ru.6a |  | 2-methylpyridine | 89 | 33 |

Conditions: $28 \mu \mathrm{~mol}$ of $3.13 \mathrm{a}, 28 \mu \mathrm{~mol}$ of $3.14 \mathrm{a}, 1.4 \mu \mathrm{~mol}$ of [Ru], $9.7 \mu \mathrm{~mol}$ of $\mathrm{Mel}, 2.8 \mu \mathrm{~mol}$ of $\mathrm{PPh}_{3}, 11 \mu \mathrm{~mol}$ of a pyridine derivative, 0.125 M in solvent; Yields and conversions of oxa-benzonorbornadiene 3.13a were determined by ${ }^{1} \mathrm{H}$ NMR with $\mathrm{CH}_{2} \mathrm{Br}_{2}$ as internal standard; A single diastereomer was observed; enantiomeric ratio was determined by HPLC with a chiral stationary phase.; [a] Without addition of iodomethane.

The influence of 2-methylpyridine as an additive was checked on other alkynes. Two sets of reaction conditions were evaluated (Table 3-7). The first one, without additive, gave the best yield for dipropargyl alcohol 3.14a, while the conditions employing 2-methylpyridine gave the highest enantioselectivity in that case. In contrast to the reaction with di-propargyl alcohol 3.14a, the additive did not increase selectivity for the reaction of alkynes such as dimethyl ether 3.14b or dicarbonate 3.14c (Entry 3-6). In both cases, the addition of 2-methylpyridine resulted in a slight loss in yield with virtually the same enantioselectivity. Those results lead to the conclusion that pyridine derivatives increase the enantioselectivity only for di-propargyl alcohol substrate 3.14a.

Table 3-7: The effect of a pyridine derivative on other alkynes.

Conditions 1: $28 \mu \mathrm{~mol}$ of 3.13a, $28 \mu \mathrm{~mol}$ of $\mathbf{1 4}, 1.4 \mu \mathrm{~mol}$ of Ru.4ba, $9.7 \mu \mathrm{~mol}$ of Bu4 $\mathrm{NI}, 1.4 \mu \mathrm{~mol}$ of $\mathrm{PPh}_{3}, 0.125$ M in solvent; Conditions $2 .: 28 \mu \mathrm{~mol}$ of 3.13a, $28 \mu \mathrm{~mol}$ of 3.14, $1.4 \mu \mathrm{~mol}$ of Ru.4ba, $9.7 \mu \mathrm{~mol}$ of Mel, $2.8 \mu \mathrm{~mol}$ of $\mathrm{PPh}_{3}, 11 \mu \mathrm{~mol}$ of 2-methylpyridine, 0.125 M in solvent; Yields and conversions of oxa-benzonorbornadiene 3.13a were determined by ${ }^{1} \mathrm{H}$ NMR with $\mathrm{CH}_{2} \mathrm{Br}_{2}$ as internal standard; A single diastereomer was observed; enantiomeric ratio was determined by HPLC with a chiral stationary phase.

With those results in hand, the optimization for the reaction was performed again with butyne dicarbonate 3.14c. Each component of the previous reaction conditions was re-evaluated to confirm its effect (Table 3-8). At first, the effects of triphenyl phosphine and tetrabutylammonium iodide were investigated. In contract to the case with di-propargyl alcohol 3.13a, the omission of triphenylphosphine showed very little effect on enantioselectivity, (94:6 er, Entry 1 and 2) A decreased loading of tetrabutylammonium iodide was also evaluated, having virtually no effect on both yield and enantioselectivity (57\% yield with 95:5 er, Entry 3 and 4).

Table 3-8: Effect of triphenylphosphine and tetrabutylammonium iodide.

| Entry | PPh $_{3}$ | $\mathrm{Bu}_{4} \mathbf{N I}$ | Conversion [\%] | Yield [\%] | er |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 1 | $5 \mathrm{~mol} \%$ | $35 \mathrm{~mol} \%$ | 100 | 57 | $93.5: 6.5$ |
| 2 | None | $35 \mathrm{~mol} \%$ | 100 | 53 | $94: 6$ |
| 3 | None | $10 \mathrm{~mol} \%$ | 100 | 56 | $95: 5$ |
| 4 | None | $6 \mathrm{~mol} \%$ | 100 | 57 | $95: 5$ |

Conditions: $42 \mu \mathrm{~mol}$ of $3.13 \mathrm{a}, 42 \mu \mathrm{~mol}$ of $3.14 \mathrm{c}, 2.1 \mu \mathrm{~mol}$ of Ru.4ba, $6-35 \mathrm{~mol} \%$ of Bu4NI, $2.1 \mu \mathrm{~mol}$ of $\mathrm{PPh}_{3}$ or not, 0.125 M in solvent; Yields and conversions of oxa-benzonorbornadiene 3.13a were determined by ${ }^{1} \mathrm{H}$ NMR with $\mathrm{CH}_{2} \mathrm{Br}_{2}$ as internal standard; A single diastereomer was observed; enantiomeric ratio was determined by HPLC with a chiral stationary phase.

The choice of solvent was also re-evaluated (Table 3-9). Polar coordinating solvents such as acetonitrile lowered the reaction rate and brought about a poor yield (10\%) with moderate enantioselectivity, 87.5:12.5 er (Entry 1). Dioxane and acetone improved both yield and enantioselectivity, $58 \%$ yield with $93: 7$ er (Entry 2 and 3). 2-Butanone, which has similar properties to acetone, slightly improved enantioselectivity ( $95: 5 \mathrm{er}$ ) with $57 \%$ yield (Entry 4 ). The reaction temperature screening was performed without triphenylphosphine and a lower loading of tetrabutylammonium iodide at $6 \mathrm{~mol} \%$, (Entry 5-8). This screening showed that $100^{\circ} \mathrm{C}$ is the optimal temperature for the reaction (Entry 7), giving the product in the highest yield, 71\%, along with a high enantioselectivity ( $95: 5 \mathrm{er}$ ). Notably, enantioselectivity was not affected by the reaction temperature.

Table 3-9: Temperature and solvent screening without $\mathrm{PPh}_{3}$.

| Entry | Solvent | Temperature | Conversion [\%] | Yield [\%] | er |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 1 | acetonitrile | 60 | 55 | 10 | $87.5: 12.5$ |
| 2 | dioxane | 60 | 100 | 58 | $93: 7$ |
| 3 | acetone | 60 | 100 | 53 | $93: 7$ |
| 4 | 2-butanone | 60 | 100 | 57 | $95: 5$ |
| 5 | 2-butanone | 40 | 100 | 19 | $95: 5$ |
| 6 | 2-butanone | 80 | 100 | 66 | $95: 5$ |
| 7 | 2-butanone | 100 | 100 | $\mathbf{7 1}$ | $95: 5$ |
| 8 | 2-butanone | 120 | 100 | 61 | $95: 5$ |

Conditions: $42 \mu \mathrm{~mol} 3.13 \mathrm{a}, 42 \mu \mathrm{~mol}$ of $3.14 \mathrm{c}, 2.1 \mu \mathrm{~mol}$ Ru.4ba, $2.5 \mu \mathrm{~mol}$ Bu4NI, 0.125 M in solvent, 30 min ; Isolated yields, conversions determined by ${ }^{1} \mathrm{H}$ NMR with $\mathrm{CH}_{2} \mathrm{Br}_{2}$ as internal standard; A single diastereomer was observed; enantiomeric ratio was determined by HPLC with a chiral stationary phase.

The effect of the halide counterion and ligand were then reinvestigated (Table 3-10). Binaphthylderived $\mathrm{Cp}^{\mathrm{x}}$ ruthenium complexes Ru.2bf and Ru.2ba, ${ }^{65 \mathrm{c}}$ which have been successfully utilized for other ruthenium catalyzed asymmetric reactions, gave the product in poor yield of 9-23\% and low enantioselectivity (Entry 1 and 2). Cyclopentane-fused $\mathrm{Cp}^{\mathrm{x}}$ ruthenium complex Ru.4ba induced a significantly higher yield, $71 \%$, with excellent enantioselectivity (95:5 er) (Entry 3). Other halides, bromide and chloride, had detrimental effects on the reaction in terms of reactivity and enantioselectivity (Entry 4 and 5). Conducting the reaction without a halide additive resulted in a substantially decreased yield and enantioselectivity ( $31 \%$ yield and 69.5:30.5 er). (Entry 6), showing the importance of a coordinating halide on the ruthenium complex. Starting materials 3.13a and 3.14c were recovered from the control reaction without ruthenium and halide additive.

Table 3-10: Ligand and halide additive screening.

| Entry | Ru cat. | Additive | Conversion [\%] | Yield [\%] | er |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 1 | Ru.2bf | $\mathrm{Bu}_{4} \mathrm{NI}$ | 100 | 9 | $67: 33$ |
| 2 | Ru.2ba | $\mathrm{Bu}_{4} \mathrm{NI}$ | 100 | 23 | $70.5: 29.5$ |
| 3 | Ru.4ba | $\mathrm{Bu}_{4} \mathrm{NI}$ | 100 | 71 | $95: 5$ |
| 4 | Ru.4ba | $\mathrm{Bu}_{4} \mathrm{NBr}$ | 100 | 47 | $94: 6$ |

| 6 | Ru.4ba | none | 100 | 31 | $69.5: 30.5$ |
| 8 | none | none | 7 |  |  |

Conditions: $42 \mu \mathrm{~mol} 3.13 \mathrm{a}, 42 \mu \mathrm{~mol}$ of $\mathbf{3 . 1 4 c}, 2.1 \mu \mathrm{~mol}[R u], 2.5 \mu \mathrm{~mol}$ Additive, $0.125 \mathrm{M} \mathrm{in} \mathrm{2-butanone}$,30 min ; Isolated yields, conversions determined by ${ }^{1} \mathrm{H}$ NMR with $\mathrm{CH}_{2} \mathrm{Br}_{2}$ as internal standard; A single diastereomer was observed; enantiomeric ratio was determined by HPLC with a chiral stationary phase.

### 3.3 Reaction Scope

The scope of the reaction was investigated, firstly by examining different alkyne groups (Table 3-11). Internal alkynes with propargylic carbonates delivered the desired exo-benzonorcaradiene 3.15 well, with yields ranging from 65-76\% as well as high enantioselectivities (ca. 95:5 er) (Table 3-11, Entry 1-3). Alkyne $\mathbf{3 . 1 4 f}$ with carbamoyl moieties also worked well, and brought about a good yield of 3.15af ( $63 \%$ ) with high enantioselectivity, $93: 7$ er (Table 3-11, Entry 4). Alkynes with propargylic benzoate $\mathbf{3 . 1 4 g}$ and acetate substituents $\mathbf{3 . 1 4 h}$ were transformed to the corresponding
benzonorcaradienes (3.15ag and 3.15ah) in good yields and high enantioselectivities (Table 3-11, Entry 5 and 6). The influence of coordinating groups on the substrates was probed with alkynes bearing tert-butyldimethylsilyl ether 3.14i or benzyl ether moieties $\mathbf{3 . 1 4 j}$ (Table 3-11, Entry 7 and 8). They both gave the corresponding product with decreased enantioselectivities of 74:26 er and 75:25 er, respectively. Compared to the case of propargylic benzoate $\mathbf{3 . 1 4 g}$ (Table 3-11, Entry 5), the case of benzyl ether substrate 3.14j exhibits the impact of coordinating substituents on enantioselectivity. A noticeable result came from employing thioester-containing alkyne $\mathbf{3 . 1 4 k}$, which was transformed to the respective product with a high enantioselectivity of 97.5: 2.5 er (Table 3-11, Entry 9). An alkyne substrate with free hydroxyl groups 3.14a was tolerated, and delivered the corresponding benzonorcaradiene in $63 \%$ yield and 85:15 er (Table 3-11, Entry 10). As described in the previous chapter, enantioselectivity for this substrate could be increased to $97.5: 2.5$ er by using 2 methylpyridine as an additive (Table 3-6, Entry 4). Unsymmetrical alkynes that contain only a single propargylic oxygen induced lower yields than the cases with symmetrical ones (Table 3-11, Entry $11-14)$. The main cause of the decrease in yield was a competing [2+2]-cycloaddition process, which produced cyclobutene byproducts. ${ }^{65 \mathrm{a}, \mathrm{b}}$ Even though yield of the desired benzonorcaradiens was low, only a single regioisomer was observed. Inter-ligand interaction by hydrogen bonding between ruthenium halide and a hydroxyl group of propargyl alcohol ${ }^{99}$ or interaction between lone pair of a halide and $\pi^{*}$ orbital of a carbonyl group ${ }^{100}$ set the orientation of a coordinating alkyne. Presumably, it induces high regioselectivity on these unsymmetrical alkynes. The enantiomeric ratio of the desired benzonorcaradiene 3.15al, 3.15am and 3.15an was excellent, 94:6 to 97:3 er. The alkyne possessing one free hydroxyl group and one methyl carbonate gave a 2.9:1 mixture of regioisomers 3.15ao and 3.15ao' in 60\% combined yield (Table 3-11, Entry 14).

Conditions: $104 \mu \mathrm{~mol}$ 3.13a, $104 \mu \mathrm{~mol}$ of $\mathbf{1 4 z}, 5.2 \mu \mathrm{~mol}$ Ru.4ba, $6.2 \mu \mathrm{~mol} \mathrm{Bu}_{4} \mathrm{NI}, 0.125 \mathrm{M}$ in 2-butanone, 30 min.; Isolated yields; A single diastereomer was observed; enantiomeric ratio was determined by HPLC with a chiral stationary phase.; [a] $5 \mathrm{~mol} \%$ Ru.4ba, $35 \mathrm{~mol} \% \mathrm{Mel}, 10 \mathrm{~mol} \% \mathrm{PPh}_{3}, 40 \mathrm{~mol} \%$ 2-methylpyridine, 0.125 M at $80^{\circ} \mathrm{C}$ for 90 min .

Next, the scope of oxa-benzonorbonradienes was explored (Table 3-12). An oxabenzonorbornadiene bearing electron-donating methoxy groups 3.13b was converted to the desired benzonorcaradiene 3.15bc in 65\% yield and 92:8 er (Entry 1). Analogously, 5,8-dimethoxy oxabenzonorbornadiene 3.13c, an isomer of 3.13b, gave the corresponding benzonorcaradiene 3.15cc in 62\% yield and 88:12 er (Entry 2). In this case, a slight decrease of enantioselectivity was observed. Presumably, the methoxy group proximal to the newly generated stereogenic centers slightly impedes the enantiodetermining step. A slight decrease in yield was attributed to the relatively lower stability of the benzonorcaradiene products 3.15 bc and 3.15 cc compared to the parent product 3.15ac. 6,7-Dimethyl-substituted oxa-benzonorbornadiene 3.13 d smoothly delivered the
corresponding benzonorcaradiene 3.15dc in $81 \%$ yield and 92.5:7.5 er (Entry 3). An oxabenzonorbornadiene containing electron withdrawing groups, 6,7-dibromo substituted oxabenzonorbornadiene, gave product 3.15 ec in a moderate yield of $48 \%$ (Entry 4), but with high enantioselectivity (96:4 er).

Table 3-12: Variation of oxa-benzonorbonadiene.

Conditions: $104 \mu \mathrm{~mol} 3.13 \mathrm{z}$, $104 \mu \mathrm{~mol}$ of 3.14c, $5.2 \mu \mathrm{~mol}$ Ru.4ba, $6.2 \mu \mathrm{~mol}$ Bu4NI, 0.125 M in 2-butanone, 30 min.; Isolated yields; A single diastereomer was observed; enantiomeric ratio was determined by HPLC with a chiral stationary phase.

A crystal of benzonorcaradiene 3.15aa was obtained by slow evaporation of a solution of 3.15aa in dichloromethane. The absolute stereochemistry of benzornocaradiene of 3.15aa was determined by X-ray crystallography (Figure 3-2). ${ }^{101}$

Figure 3-2: Crystal structure of 3.15aa.

### 3.4 Reaction Mechanism Study

The reaction mechanism can be grouped into two parts: a ruthenium-based catalytic cycle followed by a series of pericyclic reactions (Scheme 3-4). ${ }^{95}$ The cationic ruthenium species, $\mathrm{Cp}{ }^{\times} \mathrm{Ru}\left(\mathrm{CH}_{3} \mathrm{CN}_{3}{ }_{3} \mathrm{PF}_{6}\right.$, and tetrabutylammonium iodide produce a neutral ruthenium iodide complex. Coordination of oxa-benzonorcaradiene 3.13a and the resulting neutral ruthenium iodide form intermediate 3.17. Oxidative addition of the ruthenium iodide into a $\mathrm{C}-\mathrm{O}$ bond of intermediate 3.17 and subsequent coordination of an alkyne results in the formation of ruthenacycle 3.18. Particularly, the oxidative addition into a $\mathrm{C}-\mathrm{O}$ bond ${ }^{102}$ is the enantio-determining step of the reaction: the stereochemistry is determined by which $\mathrm{C}-\mathrm{O}$ bond reacts. Migratory insertion of intermediate 3.18 into the coordinated alkyne brings about ruthenacycle 3.19, followed by reductive elimination regenerating ruthenium iodide $\mathbf{3 . 1 6}$ ([Ru]) and releasing allylvinyl ether 3.20. The allylvinyl ether $\mathbf{3 . 2 0}$ forms an endo-product 3.21 through a Claisen rearrangement. Thermal conditions allow the endoproduct 3.21 to isomerize into benzo cycloheptatriene 3.22 via $6 \pi$-electrocyclic ring opening. Ringflip of benzo cycloheptatriene $\mathbf{3 . 2 2}$ results in a benzo cycloheptatriene 3.22', which is followed by a
$6 \pi$-electrocyclic ring closing. As a result, the thermodynamically more stable exo-proudct 3.15 is generated.

Scheme 3-4: Proposed reaction mechanism of the $\mathrm{Cp}^{\times R u}$ (II)-catalyzed coupling of oxa-benzonorbornadienes and alkynes..

### 3.4.1 Control Experiments

Experimental evidence to support the proposed reaction mechanism was obtained from a series of experiments. Reactions at a lower temperature of $40^{\circ} \mathrm{C}$ were conducted using $\mathrm{CpRu}\left(\mathrm{CH}_{3} \mathrm{CN}_{3} \mathrm{PF}_{6}\right.$ and cyclopentane-fused chiral $\mathrm{Cp}^{\times} \mathrm{Ru}(\mathrm{II})$ complex Ru.4ba, respectively. At this lower reaction temperature, the achiral catalyst delivered $54 \%$ yield of endo-product 3.21ac with trace amounts of
exo-product 3.15ac (Scheme 3-5, equation 1). Analogous results were obtained with chiral catalyst Ru.4ba, which gave endo-product 3.21ac in 74\% yield with trace amounts of exo-product 3.15ac (Scheme 3-5, equation 2). Under the standard reaction conditions without ruthenium catalyst, the isolated endo-product 3.21ac isomerized to exo-product 3.15ac in a near-quantitative yield of 96\% (Scheme 3-5, equation 3). This corroborates the hypothesis that the endo-to-exo isomerization is a thermal process that does not require the ruthenium catalyst. In addition, the enantiomeric ratio of the exo-product 3.15ac obtained from the control experiment was $94.5: 5.5$, which is virtually same as that obtained from the standard reaction conditions. This observation indicates that the enantiodetermining step of the reaction occurs prior to the formation of endo-product 3.21ac, and endo-toexo isomerization is a stereospecific process.

Scheme 3-5: Mechanistic experiments.

### 3.4.2 Computational Studies

The experimental results were corroborated by DFT calculations. For the optimization of geometries of all species, the B3LYP ${ }^{103}$ functional was used with the Pople basis set ${ }^{104} 6-31$ G. The same method and basis set were applied to thermal analysis and zero-point energy correction for computing Gibbs free energy, and a scale factor for vibrational analysis was applied. ${ }^{105}$ All transition states only have a single imaginary vibrational mode, and none of the intermediates have an imaginary vibrational frequency.

In order to further confirm the Claisen-electrocyclic pathway, ${ }^{106}$ computational studies were conducted using GAMESS ${ }^{107}$. The results of computational studies are summarized in an energy profile diagram (Figure 3-3). This profile fits well with the experimental results and explains. The activation energy of the Claisen rearrangement (allyl vinyl ether 3.20ac to endo-isomer 3.21ac) is $15.8 \mathrm{kcal} / \mathrm{mol}$, which means that allyl vinyl ether 3.20ac has a half-life of only 11 ms at $40^{\circ} \mathrm{C}$, explaining the failure to experimentally observe allyl vinyl ether 3.20ac. In addition, a decrease of Gibbs free energy from allyl vinyl ether 3.20ac to endo-product 3.21ac to $-9.7 \mathrm{kcal} / \mathrm{mol}$ conveys that this Claisen rearrangement is a spontaneous process. TS1 has a boat-like geometry due to structural constraints of allyl vinyl ether 3.20ac. In addition, the computational results account for the high preference of exo-benzonorcaradiene 3.15ac over endo-benzonorcaradiene 3.21ac. The endo-toexo isomerization is an energetically downhill process. The energies of endo-benzonorcaradiene 3.21ac and exo-benzonorcaradiene 3.15ac are $-9.7 \mathrm{kcal} / \mathrm{mol}$ and $-13.1 \mathrm{kcal} / \mathrm{mol}$, respectively. The energy gap between endo-isomer 3.21ac and exo-isomer 3.15ac of $3.4 \mathrm{kcal} / \mathrm{mol}$ translates to a molar ratio of $>98: 1$ at $100^{\circ} \mathrm{C}$ if the system reaches an equilibrium state. Hence, only exo-isomer 3.15ac was observed after thermal isomerization of the isolated endo-product 3.21ac. Furthermore, even though the endo-to-exo isomerization is an energetically favorable process, it has a high activation energy of $27.8 \mathrm{kcal} / \mathrm{mol}$, which is $12 \mathrm{kcal} / \mathrm{mol}$ higher than that of the Claisen rearrangement step. This high activation energy made it feasible to isolate endo-product 3.21ac. The other experimental observation that the computational study accounts for the reason why the two cycloheptatrienes 3.22ac and 3.22ac' were not observed. They both have a $14-20 \mathrm{kcal} / \mathrm{mol}$ higher energy than benzonorcaradienes 3.21ac and 3.15ac, indicating that the equilibrium between benzonorcaradienes (3.21ac, 3.15ac) and cycloheptatrienes (3.22ac, 3.22ac') will lean significantly to the benzonorcaradienes. In addition, the conversion from cycloheptatrienes 3.22ac and 3.22ac' to benzonorcaradienes 3.21ac and 3.15ac has almost no barrier, enabling a rapid transition to the benzonorcaradienes. Overall, the computational results corroborate the experimental results and the proposed mechanism.

An alternative reaction pathway was ruled out based on the computational results. This proposed pathway consists of a ring-contraction of dihydrofuran 3.23ac as an intermediate, producing endobenzonorcaradiene 3.21ac. ${ }^{95,108}$ However, the transformation from dihydrofuran 3.23ac to exobenzonorcaradiene 3.15ac is energetically uphill in terms of Gibbs free energy. In other words, if there is a chemical equilibrium between dihydrofuran 3.23ac and exo-benzonorcaradiene 3.15ac, dihydrofuran 3.23ac should be the major product because of its lower Gibbs free energy. As the major product was exo-benzonorcaradiene 3.15ac and no dihydrofurane was observed in the reaction mixture, this pathway was discarded.

3.23ac

Chapter 4 Enantioselective Ruthenium(II)Catalyzed Alkylative Cycloetherification

### 4.1 Introduction

Oxygen-containing heterocycles are one of the major structural motifs in natural products and pharmaceutical compounds. Among them, furan, pyrrole and spiroketal moieties are associated with intriguing biological activities, such as cytotoxic activity on leukemia and breast cancer cells, ${ }^{109}$ antitumor activity, ${ }^{110}$ inhibition of monoamine oxidase (MAO) ${ }^{111}$ and reverse transcriptase of HIV-1, and anti-telomerase activity. ${ }^{112}$ Because of their high potency in pharmaceutical applications, there is a strong demand for concise, enantioselective synthetic approaches towards these oxa-cycles.

Figure 4-1: Biologically active compounds containing furan, pyran, and spiroketal motifs.

The Trost group has explored ruthenium-catalyzed transformations and proposed the possibility of an alkylative cycloetherification. ${ }^{27 a, b}$ They reported a ruthenium catalyzed ene type reaction, and proposed the formation of an allylruthenium intermediate 4.3, which, in turn, forms an 1,3-diene (Scheme 4-1). ${ }^{30}$

Scheme 4-1: Ruthenium catalyzed ene-type reaction towards 1,3-dienes.

As an extension of their previous research, they developed a ruthenium-catalyzed cycloetherification of allenols (Scheme 4-2a). ${ }^{113}$ They postulated the formation of a $\pi$-allylruthenium complex, followed by intramolecular nucleophilic addition. This transformation gives an atom-economic approach to cyclic ethers and gives experimental support for the involvement of allylruthenium intermediate 4.9. The resulting cyclic ethers 4.10 were utilized as precursors for spiroketals 4.12 (Scheme 4-2b).

Trost, 1999
a) Alkylative cycloetherification

b) Spiroketal formation using the resulting cyclic ether

Scheme 4-2: Ruthenium catalyzed cycloetherification.

The authors proposed two different mechanisms. The first mechanism is initiated by oxidative cyclization of allenol 4.5 and Michael acceptor 4.6, which constitutes the enantio-determining step
(Scheme 4-3). The resulting $\sigma$-allylruthenium intermediate 4.14 (Scheme 4-3) forms a $\pi$ allylruthenium complex (4.15). An intramolecular nucleophilic attack of the hydroxyl group produces ruthenium enolate ( 4.16 , Scheme 4-3). Protonation of intermediate 4.16 releases the desired cyclic ether 4.8 and regenerates the active ruthenium species. The second possible pathway is a ruthenium catalyzed intramolecular addition of the allene, forming intermediate 4.17. Conjugate addition of alkenyl ruthenium intermediate 4.17 delivers ruthenium enolate 4.16 in the enantio-determining step of this reaction pathway. Protonation gives the desired cyclic ether 4.8.

Scheme 4-3: Two proposed mechanisms of ruthenium catalyzed cycloetherification.

### 4.2 Optimization Studies for Enantioselective Ruthenium(II)-Catalyzed Alkylative Cycloetherification

Allenol 4.18 and phenylvinyl ketone 4.19 were chosen as a model system for optimization of the enantioselective ruthenium(II)-catalyzed alkylative cycloetherification (Table 4-1). Achiral cationic CpRu (II) complex 4.21 gave the desired tetrahydrofuran 4.20 in $62 \%$ yield (Entry 1). The reactivity of $\mathrm{Cp}^{*} \mathrm{Ru}$ (II) complex 4.22 was much lower than that of $\mathrm{CpRu}(\mathrm{II})$ complex 4.21 , giving 4.20 in only $21 \%$ yield (Entry 2). The reaction with binaphthyl-derived $\mathrm{Cp}^{\times} \mathrm{Ru}(I I)$ complex Ru.2ba gave a similar reactivity, ( $22 \%$ yield) with an enantiomeric ratio of 70:30 (Entry 3), demonstrating the feasibility of rendering the transformation enantioselective.

Table 4-1: Proof of concept for enantioselective ruthenium(II)-catalyzed alkylative cycloetherification.

| Entry | Ru | Conversion [\%] | Yield [\%] | er |
| :--- | :--- | :--- | :--- | :--- |
| 1 | $\mathrm{CpRu}\left(\mathrm{CH}_{3} \mathrm{CN}^{2}\right) \mathrm{PF}_{6} 4.21$ | 100 | 62 | - |
| 2 | $\mathrm{Cp}{ }^{*} \mathrm{Ru}\left(\mathrm{CH}_{3} \mathrm{CN}\right) \mathrm{PF}_{6} 4.22$ | 100 | 21 | - |
| 3 | Ru.2ba | 100 | 22 | $70: 30$ |

Conditions: $30 \mu \mathrm{~mol} 4.18$, $45 \mu \mathrm{~mol}$ of $4.19,3.0 \mu \mathrm{~mol}$ Ru.2ba, $4.6 \mu \mathrm{~mol} \mathrm{CeCl}_{3} \cdot 7 \mathrm{H}_{2} \mathrm{O}, 0.25 \mathrm{M}$ in solvent, 2 h ; Yields and conversions of allenol 4.18 determined by ${ }^{1} \mathrm{H}$ NMR with an internal standard; enantiomeric ratio was determined by HPLC with a chiral stationary phase.

As a next step, different solvents were evaluated (Table 4-2). Among the ethereal solvents, THF and cyclopentyl methyl ether brought about ca. $40 \%$ yield with low enantioselectivity (up to $63: 37$ er,

Entry1 and 2). Compared to other ethereal solvents, 1,4-dioxane improved the yield to 66\%, but with no improvement in enantioselectivity (Entry 3). The reaction in 2-butanone gave similar results (62\% yield and 62:38 er, Entry 4). 1,2-Dichloroethane as an example for chlorinated solvents gave only a marginal change in enantioselectivity, 60:40 er (Entry 5). A polar aprotic solvents dimethylformamide (DMF) was beneficial for increasing the enantioselectivity to ca. 70:30 er. However, the yield of $\mathbf{4 . 2 0}$ decreased to $22 \%$ (Entry 6). Dimethylacetamide (DMA) had a similar effect on both of yield and enantioselectivity (Entry7). Even though the yield was poor, the polar aprotic solvents dimethyl sulfoxide, acetonitrile, and dimethylpropyleneurea (DMPU) slightly improved enantioselectivity to 76:24 er (Entry8-10). The use of an alcoholic solvent, isopropyl alcohol, resulted in poor yield and enantioselectivity (Entry 11).

Table 4-2: Solvent screening.

| Entry | Solvent | Conversion [\%] | Yield [\%] | er |
| :--- | :--- | :--- | :--- | :--- |
| 1 | THF | 100 | 41 | $63: 37$ |
| 2 | cyclopentyl methyl ether | 100 | 37 | $58: 42$ |
| 3 | 1,4-dioxane | 100 | 66 | $61: 39$ |
| 4 | 2-butanone | 100 | 62 | $62: 38$ |
| 5 | 1,2-dichloroethane | 100 | 46 | $60: 40$ |
| 6 | DMF | 100 | 22 | $70: 30$ |
| 7 | DMA | 100 | 21 | $69: 31$ |
| 8 | DMSO | 64 | 5 | $75: 25$ |
| 9 | acetonitrile | 100 | 24 | $76: 24$ |
| 10 | DMPU | 100 | 26 | $64: 36$ |
| 11 | isopropyl alcohol | 100 | 21 | $58.5: 41.5$ |

Conditions: $13 \mu \mathrm{~mol} 4.18,20 \mu \mathrm{~mol}$ of $4.19,1.3 \mu \mathrm{~mol}$ Ru.2ba, $2.0 \mu \mathrm{~mol} \mathrm{CeCl}_{3} \cdot 7 \mathrm{H}_{2} \mathrm{O}, 0.25 \mathrm{M}$ in solvent, 3 h ; Yields and conversions of allenol 4.18 determined by ${ }^{1} \mathrm{H}$ NMR with an internal standard; enantiomeric ratio was determined by HPLC with a chiral stationary phase.

A control experiment was performed without the addition of any Lewis acid, causing a drastic drop in yield compared to the reaction with cerium (III) chloride hydrate. (Table 4-3).

Table 4-3: The effect of Lewis acid with achiral CpRu complex.

Conditions: $21 \mu \mathrm{~mol} 4.18,32 \mu \mathrm{~mol}$ of 4.19 , $2.1 \mu \mathrm{~mol} \mathrm{CpRu}\left(\mathrm{CH}_{3} \mathrm{CN}_{3} \mathrm{PFF}_{6}, 3.2 \mu \mathrm{~mol} \mathrm{CeCl} 3 \cdot 7 \mathrm{H}_{2} \mathrm{O}, 0.25 \mathrm{M}\right.$ in DMF, 2 h ; Yields and conversions of allenol 4.18 determined by ${ }^{1} \mathrm{H}$ NMR with an internal standard; enantiomeric ratio was determined by HPLC with a chiral stationary phase.

However, an opposing effect was observed on the Cp×Ru(II) system (Table 4-4). Adding cerium (III) chloride hydrate had an adverse effect on both yield and enantioselectivity, ( $22 \%$ yield and 70:30 er, Entry 2). Tin(IV) chloride gave slightly better results, but still worse than the reaction without Lewis acid (Entry 3). Stronger Lewis acids also gave no improvement (Entry 3-6).

Table 4-4: Lewis acid screening with $\mathrm{Cp}^{\times R u}$ (II).

| Entry | Lewis Acid | Conversion [\%] | Yield [\%] | er |
| :--- | :--- | :--- | :--- | :--- |
| 1 | none | 100 | 37 | $82: 18$ |
| 2 | $\mathrm{CeCl}_{3} \cdot 7 \mathrm{H}_{2} \mathrm{O}$ | 100 | 22 | $70: 30$ |
| 3 | $\mathrm{SnCl}_{4} \cdot 5 \mathrm{H}_{2} \mathrm{O}$ | 100 | 35 | $73: 27$ |
| 4 | $\mathrm{TiCl}_{4}$ | 100 | 30 | $72: 28$ |
| 5 | $\mathrm{~B}_{4}\left(\mathrm{~F}_{5}\right)_{3}$ | 100 | 29 | $79.5: 29.5$ |
| 6 | $\mathrm{BF}_{3} \cdot \mathrm{OEt}_{2}$ | 100 | 36 | $81.5: 18.5$ |

Conditions: $13 \mu \mathrm{~mol} 4.18$, $20 \mu \mathrm{~mol}$ of 4.19, $1.3 \mu \mathrm{~mol}$ Ru.2ba, $2.0 \mu \mathrm{~mol}$ Lewis acid, 0.25 M in solvent, 3 h ; Yields and conversions of allenol 4.18 determined by ${ }^{1} \mathrm{H}$ NMR with an internal standard; enantiomeric ratio was determined by HPLC with a chiral stationary phase.

The effect of halide additives, which lead to the formation of a neutral ruthenium complex, was also evaluated (Table 4-5). A fluoride additive shut down reactivity (Entry 2), while chloride, bromide and iodide caused slight drop yield, accompanied by a notable decrease in enantioselectivity (Entry 35).

Table 4-5: Halide additive screening.

| Entry | $\mathrm{Bu}_{4} \mathrm{NX}$ | Conversion [\%] | Yield [\%] | er |
| :--- | :--- | :--- | :--- | :--- |
| 1 | none | 100 | 37 | $82: 18$ |
| 2 | $\mathrm{Bu}_{4} \mathrm{NF}$ | 57 | 0 | - |
| 3 | $\mathrm{Bu}_{4} \mathrm{NCl}$ | 100 | 36 | $71: 29$ |
| 4 | $\mathrm{Bu}_{4} \mathrm{NBr}$ | 100 | 33 | $72: 28$ |
| 5 | $\mathrm{Bu}_{4} \mathrm{NI}$ | 100 | 31 | $67: 33$ |

Conditions: $13 \mu \mathrm{~mol} 4.18,20 \mu \mathrm{~mol}$ of $4.19,1.3 \mu \mathrm{~mol}$ Ru.2ba, $1.5 \mu \mathrm{~mol}$ tetrabutylammonium halide, 0.25 M in solvent, 3 h ; Yields and conversions of allenol 4.18 determined by ${ }^{1} \mathrm{H}$ NMR with an internal standard; enantiomeric ratio was determined by HPLC with a chiral stationary phase.

The effect of the counteranion of the ruthenium complex was conducted, revealing a substantial impact on both reactivity and enantioselectivity (Table 4-6). A triflate anion, which is a stronger $\sigma$ donor, caused a decrease in yield and enantioselectivity (Entry 1). Similar results were obtained using bistriflimide ( $\mathrm{NTf}_{2}{ }^{-}$) (Entry 2). Tetrafluoroborate $\left(\mathrm{BF}_{4}^{-}\right)$, as weakly coordination anion, ${ }^{114}$ brought about significantly worse results than hexafluorophosphate ( $\mathrm{PF}_{6}^{-}$) and hexafluoroantimonate $\left(\mathrm{SbF}_{6}^{-}\right.$ ) Among these three anions, hexafluorophosphate gave the best yield of $37 \%$ and enantioselectivity ( $82: 18 \mathrm{er}$ ). The bad results obtained by using tetrafluoroborate can be explained by its low stability, as it can release fluoride, which inhibits the catalytic cycle (Entry 3-5). Tetrakis[3,5bis(trifluoromethyl)phenyl]borate $\left(\mathrm{BArF}_{24}{ }^{-}\right)$, which is known as a more weakly coordinating anion than hexafluorophosphate, had a detrimental effect on reactivity ( $8 \%$ yield and $64 \%$ conversion) and enantioselectivity (67:33 er, Entry 6). ${ }^{115}$

Table 4-6: Counter anion screening.

| Entry | Counter anion | Conversion [\%] | Yield [\%] | er |
| :--- | :--- | :--- | :--- | :--- |
| 1 | $\mathrm{OTf}^{-}$ | 92 | 26 | $69.5: 30.5$ |
| 2 | $\mathrm{NTf}_{2}{ }^{-}$ | 95 | 23 | $69: 31$ |
| 3 | $\mathrm{BF}_{4}{ }^{-}$ | 81 | 15 | $69.5: 30.5$ |
| 4 | $\mathrm{PF}_{6}{ }^{-}$ | 100 | 37 | $82: 18$ |
| 5 | $\mathrm{SbF}_{6}{ }^{-}$ | 96 | 30 | $72.5: 27.5$ |
| 6 | $\mathrm{BArF}_{24}{ }^{-}$ | 64 | 8 | $67: 33$ |

Conditions: $13 \mu \mathrm{~mol} 4.18,20 \mu \mathrm{~mol}$ of 4.19, $1.3 \mu \mathrm{~mol}$ Ru.2za, 0.25 M in solvent, 3 h ; Yields and conversions of allenol 4.18 determined by ${ }^{1} \mathrm{H}$ NMR with an internal standard; enantiomeric ratio was determined by HPLC with a chiral stationary phase.

To explain the low efficiency, high conversion and low yield, side products were investigated. Dimerization of allenol 4.18 was revealed as one of the side reaction pathways, forming 1,3-diene 4.23 and 4.24. The stoichiometry of the reaction was modulated to reduce dimerization (Table 4-7). When phenyl vinyl ketone 4.19 was used as a limiting reagent with 1.5 equiv. of allenol 4.18 , the yield of the desired tetrahydrofuran derivative decreased to $26 \%$, and it formed 0.18 equiv. of dimerized products (Entry 1). When equal amounts of allenol 4.18 and phenyl vinyl ketone 4.19 were used, it decreased amount of dimerization product to 0.11 equiv, but also decreasing the yield of the desired product 4.20 to $19 \%$ (Entry 2). Compared to the standard conditions (Entry 3), a higher amount of phenyl vinyl ketone (4 equiv) almost shut down the dimerization of allenol 4.18. However, it also caused a slight drop in yield and enantioselectivity, implying that other side reaction pathways exist in the system (Entry 4).

Table 4-7: Effect of different stoichiometry.

| Entry | allenol <br> [equiv.] | phenyl vinyl ketone <br> [equiv.] | Conversion [\%] | Yield [\%] | er | dimerization |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 1 | 1.5 | 1 | $86^{\mathrm{a}}$ | $26^{\mathrm{a}}$ | $80: 20$ | 0.18 equiv. |
| 2 | 1 | 1 | 94 | 19 | $81: 19$ | 0.11 equiv. |
| 3 | 1 | 1.5 | 100 | 37 | $82: 18$ | 0.07 equiv. |
| 4 | 1 | 4 | $100^{\mathrm{b}}$ | 33 | $78: 22$ | trace |

Conditions: Used 4.18 and 4.19 mention above, $10 \mathrm{~mol} \%$ of Ru.2ba, 0.25 M in solvent, 3 h ; Yields and conversions of allenol 4.18 determined by ${ }^{1} \mathrm{H}$ NMR with an internal standard; enantiomeric ratio was determined by HPLC with a chiral stationary phase.; [a] With respect to phenyl vinyl ketone; [b] 2.7 equiv. of phenyl vinyl ketone were consumed.

As a next step, binaphthyl-derived $\mathrm{Cp}^{\mathrm{x}}$ ligands with different side walls were investigated (Table 4-8). A phenyl substituent, which has been used for yne-enone cyclization ${ }^{65 c}$ and [2+2] cycloaddition, ${ }^{65 a}$ lowered both reactivity and enantioselectivity (Entry 2). A high enantiomeric ratio of 90:10 was observed from the reaction with a triisopropyloxy substituent. The reactivity with an OTIPS side wall (Ru.2bc) was similar to that with a methoxy side wall Ru.2ba (Entry 3). However, an even bulkier silyloxy group, tert-butyldiphenylsilyloxy, was detrimental on both yield and enantioselectivity (Entry 4).

Table 4-8: Ligand substrate screening

| Entry | Ligand substituent (R) | Conversion [\%] | Yield [\%] | er |
| :--- | :--- | :--- | :--- | :--- |
| 1 | -OMe (Ru.2ba) | 100 | 37 | $82: 18$ |
| 2 | -Ph (Ru.2bf) | 66 | $16(24)$ | $79.5: 20.5$ |
| 3 | -OTIPS (Ru.2bc) | 100 | 35 | $90: 10$ |
| 4 | -OTBDPS (Ru.2bb) | 67 | $11(16)$ | $80: 20$ |

Conditions: $13 \mu \mathrm{~mol} 4.18,20 \mu \mathrm{~mol}$ of 4.19, $1.3 \mu \mathrm{~mol}$ Ru.2bz, 0.25 M in solvent, 3 h ; Yields and conversions of allenol 4.18 determined by ${ }^{1} \mathrm{H}$ NMR with an internal standard; enantiomeric ratio was determined by HPLC with a chiral stationary phase. The numbers in parentheses are yield based on recovered starting material.

### 4.3 Outlook for Enantioselective Ruthenium (II)Catalyzed Alkylative Cycloetherification

The reaction conditions for the enantioselective Ruthenium (II)-Catalyzed alkylative cycloetherification require further optimization. Exploring other silyl ether moieties like tertbutyldimethylsilyl ether or triethylsilyl ether as side walls could further improve enantioselectivity. In addition, different alkoxy groups such as isopropoxy or tert-butoxy have not been investigated yet and could potentially also enhance enantioselectivity.

The other important issue is the poor efficiency of the reaction. A detailed analysis of side reaction pathways is necessary, as the known dimerization of allenol 4.23 does not explain the high consumption of the other reaction partner, phenyl vinyl ketone 4.19. In addition, a slow addition of allenol 4.18 could be helpful for inhibiting the dimerization process.

After optimization of the reaction, different ring sizes should be evaluated. As the Trost group only employed the reaction for the synthesis of 5 - and 6 -membered rings, an extension of the scope to medium-size rings would greatly add to the synthetic potential of the transformation.

# Chapter 5 Preliminary <br> Results 

Developing Enantioselective Ru(II)-catalyzed
[2+1] Cycloaddition of Ruthenium Vinyl Carbenes

### 5.1 Introduction

Fused heterocyclic compounds such as cyclopropane-fused pyrrolidines and epoxypyrrolidines are a frequently occurring structural motif in bioactive molecules and natural products. Molecules containing a cyclopropane-fused pyrrolidine moiety are known to exhibit antidepressant effects ${ }^{116}$ and antibiotic activities. ${ }^{117}$ Epoxypyrrolidines or 6-oxa-3-azabicyclo[3.1.0]hexanes, have been discovered e.g. in epolactaene, which has neuritogenic activity, ${ }^{118}$ and hirsutellon $\mathrm{C}^{119}$ (Figure 5-1).

Figure 5-1: Biologically active compounds containing bicyclo[3.1.0]hexane and epoxypyrrolidine motifs.

Dérien and Dixneuf reported a [2+1] cycloaddition of a catalytically generated ruthenium vinyl carbene with 1, 6-enyne substrates 5.1 (Scheme 5-1). This reaction produces alkenylbicyclo[3.1.0]hexanes $\mathbf{5 . 4}$ and is initiated by the in situ generation of the ruthenium vinyl carbene from a $\mathrm{Cp} *$ Ru precursor and (trimethylsilyl)diazomethane. ${ }^{32,120}$

## Dixneuf, 2003

Scheme 5-1: [2+1] Cycloaddition of catalytically generated ruthenium vinyl carbenes and enynes.

A similar transformation was reported by Saá and coworkers in 2017, using 1,5-alkynal 5.5 as a substrate to formed epoxypyrrolidines 5.8 (Scheme 5-2). ${ }^{121}$ Similar to the reaction of Dérien and

Dixneuf, the reaction with (trimethylsilyl)diazomethane selectively gave the $Z$-isomer of the alkenyl moiety of the desired epoxypyrrolidine 5.8 ,( $>95: 5 \mathrm{Z}: \mathrm{E}) .{ }^{121}$

Saá, 2017

Scheme 5-2: [2+1] Cycloaddition of catalytic Ruthenium vinyl carbenes on an alkynal substrate.

The proposed mechanism of Dérien and Dixneuf commences with the formation of a ruthenium vinyl carbene, which is followed by coordination to the alkyne moiety of enyne substrate 5.17 (Scheme $5-3) .^{32}[2+2]$ Cycloaddition of the resulting intermediate (5.9) produces ruthenacyclobutene intermediate 5.10. Cycloreversion of 5.10 gives ruthenium carbene 5.12 , followed by a second [2+2] cycloaddition to ruthenacyclobutane 5.13, followed by reductive elimination and release of the desired alkenylbicyclo[3.1.0]hexane 5.15. The cycloreversion step from intermediate 5.10 determines the diastereoselectivity, while the second [2+2] cycloaddition is the enantio-determining step. The reaction mechanism is similar to ene-yne metathesis. However, in contrast to the Grubbs catalysts, the $\mathrm{Cp}^{*}$ Ru complex does not undergo a cycloreversion of ruthenacyclobutane intermediate 5.13 to form 1, 3-diene 5.14.

Scheme 5-3: Proposed mechanism of the [2+1] cycloaddition of catalytically generated ruthenium vinyl carbenes.

### 5.2 Optimization Studies for the Enantioselective [2+1] Cycloaddition of Catalytic Ruthenium Vinyl Carbenes

To prove the concept that Cp×Ru complexes are competent catalysts for the [2+1] cycloaddition, the reaction was conducted with enyne substrate 5.18 and trimethylsilyldiazomethane 5.19 (Table 5-1). Initially, the reaction conditions for racemic synthesis were reproduced, forming the $Z$-isomer of the desired bicyclo[3.1.0]hexane 5.20 exclusively in $94 \%$ yield (Entry 1). ${ }^{32}$ Cationic Cp*Ru complex 5.22 with tetrabutylammonium chloride also gave Z-isomer 5.20 in $85 \%$ yield (Entry 2), while the corresponding CpRu complex resulted in lower reactivity ( $37 \%$ yield, $50 \%$ conversion, Entry 3). In this case, the desired product was obtained as a mixture of $E$ - and $Z$-isomer, with the $E$-isomer as
the major product (6.7:1). The enantioenriched bicyclo[3.1.0]hexane 5.20 was obtained in $41 \%$ yield with $81 \%$ conversion, by using binaphthyl-derived Cp×Ru complex Ru.2ba (Table 5-1Entry 4). The diastereoselectivity was in between that of $\mathrm{Cp}^{*} \mathrm{Ru}(\mathrm{II}) 5.22$ and $\mathrm{CpRu}(I I) 5.23$, with a 2.0:1 E/Z ratio. The enantioselectivity of both of isomers was similar, giving 70.5:29.5 er and 70:30 er for the $E$ - and $Z$-isomer, respectively.

Table 5-1: Proof of concept for the enantioselective Ru(II)-catalyzed [2+1] cycloaddition of ruthenium vinyl carbenes.

| Entry | Ru | Conversion [\%] | Yield [\%] ${ }^{\text {b }}$ | E:Z | er <br> (E-isomer) | er (Z-isomer) |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | $\begin{aligned} & \text { Cp*Ru(COD)Cla } \\ & 5.21 \end{aligned}$ | 100 | 94 | Zisomer | - |  |
| 2 | $\begin{aligned} & \mathrm{Cp}^{*} \mathrm{Ru}\left(\mathrm{CH}_{3} \mathrm{CN}\right) \mathrm{PF}_{6} \\ & 5.22 \end{aligned}$ | 100 | 85 | Z- <br> isomer | - |  |
| 3 | $\begin{aligned} & \mathrm{CpRu}\left(\mathrm{CH}_{3} \mathrm{CN}\right) \mathrm{PF}_{6} \\ & 5.23 \end{aligned}$ | 50 | 37 (74) | 6.7:1 | - |  |
| 4 | Ru.2ba | 81 | 41 (51) | 2.0:1 | 70.5:29.5 | 70:30 |

Conditions: $28 \mu \mathrm{~mol} 5.18,30 \mu \mathrm{~mol}$ of 5.19, $1.4 \mu \mathrm{~mol}[R u], 1.7 \mu \mathrm{~mol} \mathrm{Bu} \mathrm{NCLI}^{2}, 0.30 \mathrm{M}$ in THF, 18 h ; Yields and conversions of enyne 5.18 determined by ${ }^{1} \mathrm{H}$ NMR with an internal standard.; Enantiomeric ratio was determined by HPLC with a chiral stationary phase.; [a] Without tetrabutylammonium chloride.; [b] Yields based on recovered starting material in parentheses.

The halide additive was investigated next and shown to have a significant impact on reactivity (Table 5-2). The omission of a halide additive caused a significant decrease in reactivity, giving only trace amounts of the desired product 5.20 (Entry 1). In addition, an impact on diastereoselectivity was observed. Comparing chloride with iodide, the $E$-isomer is less favored, and the reaction with iodide gave the $Z$-isomer as a major product (Entry 2-4). In terms of enantioselectivity, bulkier halides
showed an adverse influence, with an enantiomeric ratio of ca. 70:30 for both diastereomers using a chloride additive (Entry 2), and significantly lower enantioselectivities for the reactions with bromide and iodide (Entry 3 and 4).

Table 5-2: Evaluation of halide additives.

Conditions: $28 \mu \mathrm{~mol} 5.18,30 \mu \mathrm{~mol}$ of $5.19,1.4 \mu \mathrm{~mol}$ Ru.2ba, $1.7 \mu \mathrm{~mol}$ tetrabutylammonium halide, 0.30 M in THF, 18 h ; Yields and conversions of enyne 5.18 determined by ${ }^{1} \mathrm{H}$ NMR with an internal standard.; Enantiomeric ratio was determined by HPLC with a chiral stationary phase.

The reaction was conducted in different solvents, showing an impact on yield, diastereoselectivity, and enantioselectivity (Table 5-3). All reactions gave the E-isomer as the major product, with selectivities between 1.2:1 and 2.5:1. In most of cases, the E-isomer was obtained in a higher enantioselectivity than the Z-isomer. Aromatic solvents were beneficial in terms of yield (65-72\%) yield, as well as - moderately - enantioselectivity (Entry 1-3). Ethereal solvents gave slightly decrease in both conversion and yield (Entry 4-6). Dichloromethane gave moderate reactivity in terms of yield based on recovered starting material, while notably giving a slightly higher enantioselectivity of 67:33 er for the Z-isomer, (62.5:37.5 er for $E$ ) (Entry 7). The use of 2-butanone substantially decreased reactivity to $11 \%$ yield and $57 \%$ conversion (Entry 8 ). In this case, the highest enantioselectivity for $Z$-isomer was obtained with 77.5:22.5 er. The coordinating solvents dimethylformamide and acetonitrile, induced poor yield (20-26\%) without improvement on enantioselectivity (Entry 9 and 10)

Conditions: $25 \mu \mathrm{~mol} 5.18,27 \mu \mathrm{~mol}$ of $5.19,1.2 \mu \mathrm{~mol}$ Ru.2ba, $1.4 \mu \mathrm{~mol} \mathrm{Bu} \mathrm{H}^{2} \mathrm{NCl}, 0.30 \mathrm{M}$ in solvent, 18 h ; Yields and conversions of enyne 5.18 determined by ${ }^{1} \mathrm{H}$ NMR with an internal standard.; Enantiomeric ratio was determined by HPLC with a chiral stationary phase. [a] Yields based on recovered starting material in parentheses.

As a next step, the effect of different chiral Cp ligands was evaluated (Table 5-4). Cyclohexanefused $\mathrm{Cp}^{x}$ ruthenium complex Ru.8ba gave diminished reactivity ( $25 \%$ yield and $60 \%$ conversion, Entry 1) and similar or slightly better enantioselectivity compared to binaphthyl-derived $\mathrm{Cp}^{\mathrm{x}}$ ruthenium complex Ru.2ba. Interestingly, it gave the other enantiomer of the $E$-isomer as a major product 5.20 (Entry 1 and 2). Binaphthyl-derived $\mathrm{Cp}^{\times}$ligands with bulkier OTIPS sidewalls caused a decrease in yield and conversion compared to methoxy sidewall complex Ru.2ba, with virtually the same enantioselectivity for the $E$-isomer. A phenyl side wall Ru.2bf resulted in slight loss in the enantioselectivity of the $Z$-isomer ( $60: 40$ er). OTIPS side wall complex Ru.2bc reversed enantioselectivity for the Z-isomer (44.5:55.5 er) (Entry 3 and 4). An interesting outcome was
observed for tri-substituted CpRu complex Ru.9ba. The diastereoselectivity was inversed, with $E$ isomer as the minor diastereomer. Even though the reactivity was poor ( $35 \%$ conversion and $13 \%$ yield), the $E$-isomer was obtained in a good enantiomeric ratio of $87: 13$. However, the $Z$-isomer was obtained virtually as a racemate (Entry 5). Poor reactivity was observed for the reaction with cyclopentane-fused third generation $\mathrm{Cp}^{\times}$ruthenium complex Ru.4ba, with virtually no enantioselectivity induced for both diastereomers (Entry 6).

Table 5-4: Screening of different ruthenium complexes with enyne substrate 5.18

| Entry | Ru | Conversion [\%] | Yield [\%] | E:Z | er <br> (E-isomer) | er <br> (Z-isomer) |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 1 | Ru.8ba | 60 | 25 | $2.0: 1$ | $25: 75$ | $76: 24$ |
| 2 | Ru.2ba | 100 | 72 | $1.6: 1$ | $72.5: 27.5$ | $63.5: 36.5$ |
| 3 | Ru.2bf | 86 | 49 | $2.6: 1$ | $73.5: 26.5$ | $60: 40$ |
| 4 | Ru.2bc | 37 | 12 | $1: 2.3$ | $70: 30$ | ca. $44.5: 55.5$ |
| 5 | Ru.9ba | 35 | 13 | $1: 1.8$ | ca. 87:13 | $59.5: 40.5$ |
| 6 | Ru.4ba | 30 | 6 | $2.3: 1$ | $50: 50$ | $54: 46$ |

Conditions: $25 \mu \mathrm{~mol} 5.18,27 \mu \mathrm{~mol}$ of 5.19, $1.2 \mu \mathrm{~mol}[R u], 1.4 \mu \mathrm{~mol} \mathrm{Bu4NCl}, 0.30 \mathrm{M}$ in toluene, 18 h ; Yields and conversions of enyne 5.18 determined by ${ }^{1} \mathrm{H}$ NMR with an internal standard.; Enantiomeric ratio was determined by HPLC with a chiral stationary phase.

Alkynal substrate 5.24 was also evaluated under similar reaction conditions to the racemic synthesis, obtaining similar trends for the different ligands ${ }^{121}$ (Table 5-5). The neutral $\mathrm{Cp}^{*} \mathrm{Ru}(I I)$ complex (Cp*Ru(COD)Cl) delivered exclusively the Z-isomer of the desired epoxypyrrolidine 5.25 in $95 \%$ yield
(Entry 1). Cationic $\mathrm{Cp}^{*} \mathrm{Ru}(\mathrm{II})$ complex $\left(\mathrm{Cp}^{*} \mathrm{Ru}\left(\mathrm{CH}_{3} \mathrm{CN}_{3}\right)_{3} \mathrm{PF}_{6}\right)$ with an additional halide additive worked well, yielding $87 \%$ of the $Z$-isomer (Entry 2). As in the case of enyne substrate $5.18, \mathrm{CpRu}$ (II) complex ( $\mathrm{CpRu}\left(\mathrm{CH}_{3} \mathrm{CN}\right)_{3} \mathrm{PF}_{6}$ ) brought lower reactivity ( $54 \%$ conversion and $40 \%$ yield) with the $E$-isomer as the major product (Entry 3). Binaphthyl-derived $\mathrm{Cp}^{\times R u}$ (II) Ru.2ba gave enantio-enriched epoxypyrrolidine 5.25, (74:26 er for E-isomer) in $17 \%$ yield with $33 \%$ conversion, which makes the yield based on recovered starting material was $51 \%$ similar to enyne substrate 5.18. (Entry 4). The diastereoselectivity was $2.1: 1 \mathrm{dr}$ with the $E$-isomer as the major product (Entry 4). Tri-substituted Cp×Ru(II) complex Ru.9ba again induced an inversion of diastereoselectivity (1:1.4 dr), (Entry 5). Low enantioselectivity and reactivity were obtained with cyclopentane-fused third generation $\mathrm{Cp}^{\mathrm{x}}$ ruthenium Ru.4ba (Entry 6).

Table 5-5: Screening of different ruthenium complexes with alkynal substrate 5.24

Conditions: $25 \mu \mathrm{~mol} 5.24,38 \mu \mathrm{~mol}$ of $5.19,0.75 \mu \mathrm{~mol}[R u], 1.3 \mu \mathrm{~mol} \mathrm{Bu4NCI}, 0.14 \mathrm{M}$ in THF, 90 min ; Yields and conversions of alkynal 5.24 determined by ${ }^{1} \mathrm{H}$ NMR with an internal standard.; Enantiomeric ratio was determined by HPLC with a chiral stationary phase. [a] Yields based on recovered starting material in parentheses

The low conversion and poor yield of the reaction appoint to a low catalyst turnover. In order to verify this assumption, the reactions were conducted with a prolonged reaction time or a higher catalyst loading (Table 5-6). The reaction with a longer reaction time brought about nearly the same results
as the previous conditions (Entry 2), indicating that turnover of the ruthenium catalyst stops after ca. $30 \%$ conversion. A lower concentration of the substrates had a negligible effect (Entry 3). Increasing the catalyst loading to $5 \mathrm{~mol} \%$ improved the yield to $49 \%$ and the conversion to $61 \%$, which is equal to ca. twelve catalyst turnovers, only a marginal change compared to the previous conditions (Entry 4). This indicates that ca. 8 to $10 \mathrm{~mol} \%$ catalyst would be necessary to drive the reaction to completion.

Table 5-6: The effect of solvent and catalyst loading

Conditions: $25 \mu \mathrm{~mol} 5.24,38 \mu \mathrm{~mol}$ of $5.19,0.75 \mu \mathrm{~mol}$ Ru.2ba, $1.3 \mu \mathrm{~mol} \mathrm{Bu}{ }_{4} \mathrm{NCI}, 0.14 \mathrm{M}$ in toluene, 90 min ; Yields and conversions of alkynal 5.24 determined by ${ }^{1} \mathrm{H}$ NMR with an internal standard.; Enantiomeric ratio was determined by HPLC with a chiral stationary phase. [a] Yields based on recovered starting material in parentheses

Changing the reaction solvent to methanol gave an interesting result, as terminal alkene 5.26 was obtained instead of alkenylsilane 5.19 (Table 5-7). ${ }^{121}$ The reaction with neutral $\mathrm{Cp}^{*} \mathrm{Ru}(\mathrm{II})$ complex 5.21 produced this terminal alkene 5.26 in $61 \%$ yield (Entry 1). However, binaphthyl-derived CpRu(II) complex Ru.2ba only delivered a trace amount 5.26 (Entry 2 and 3). Using tetrahydrofuran as a co-solvent slightly improved the yield to $9 \%$ with $62.5: 37.5$ er.

### 5.3 Outlook for Enantioselective [2+1] Cycloaddition of Catalytically Generated Ruthenium Vinyl Carbenes

In order to increase the enantioselectivity of the transformation, more ruthenium complexes with different sidewalls should be evaluated. In particular, the effect of bulkier alkoxy sidewalls such as isopropoxy (iPrO-) and tert-butoxy (tBuO-) needs to be explored. In addition, the low diastereoselectivity needs to be addressed, possibly by employing a penta-substituted chiral congener of $\mathrm{Cp}^{*}$, as the reaction showed a high preference for the $Z$-isomer with achiral $\mathrm{Cp}{ }^{*} \mathrm{Ru}(\mathrm{II})$ complexes. A chiral penta-substituted $\mathrm{Cp}^{*}$-like ligand is available in our group, ${ }^{69}$ but has not yet been applied to ruthenium catalysis. Synthesis of the corresponding Ru(II) complexes will not only be valuable for this particular transformation, but also extend and complement the available ligand library and open potential for new reactivities.

Chapter 6 Summary

This thesis describes the synthesis of a novel class of $\mathrm{Cp}^{\mathrm{x}}$ ligands and the application of the corresponding $\mathrm{Cp}^{\mathrm{x} R u(I I)}$ complexes in enantioselective catalysis. The novel $\mathrm{Cp}{ }^{\mathrm{x}}$ ligands consist of a $\mathrm{C}_{2}$-symmetric cyclopentane-fused bicyclic skeleton with a modifiable aryl group, and can be accessed in high enantiopurity (98.5:1.5 er) by a convenient two-step synthesis (Scheme 6-1).

Scheme 6-1: Two step-synthesis of cyclopentane-fused $\mathrm{Cp}^{\times}$ligands.

A synthesis of cationic $C p^{\times R u}(I I)$ complexes and the corresponding neutral complexes was developed (Scheme 6-2). The cationic $\mathrm{Cp}^{\times} \mathrm{Ru}$ (II) complexes were accessed by complexation with TICp ${ }^{\times}$and $\left[R u\left(\mathrm{C}_{6} \mathrm{H}_{6}\right) \mathrm{Cl}_{2}\right]_{2}$, and subsequent benzene removal under UV light. The neutral complexes were also obtained from the corresponding cationic complex by ligand substitution. They can be employed as chiral congeners of $\mathrm{CpRu}\left(\mathrm{CH}_{3} \mathrm{CN}_{3}{ }_{3} \mathrm{PF}_{6}\right.$ and $\mathrm{CpRu}(\mathrm{NBD}) \mathrm{X}$, respectively.

Scheme 6-2: Cationic and neutral $\mathrm{Cp}^{\times} \mathrm{Ru}(\mathrm{II})$ complexes.

Modification of the aryl moiety gave access to cyclopentane-fused $\mathrm{Cp}^{\mathrm{x}}$ ligands with different sidewalls (Figure 6-1). The resulting ligand library can be used for tuning the chiral environment of the corresponding ruthenium complexes.

Ru.4b

Figure 6-1: Cyclopentane-fused $\mathrm{Cp} \times \mathrm{Ru}(\mathrm{II})$ complexes with various sidewalls.

The potential of the novel cyclopentane-fused $\mathrm{Cp}^{\mathrm{x}} \mathrm{Ru}(\mathrm{II})$ complexes for enantioselective catalysis was demonstrated in the diastereoselective and enantioselective synthesis of benzonorcaradienes by coupling of oxa-benzonorbornadienes and internal alkynes (Scheme 6-3). In this transformation, the cyclopentane-fused $\mathrm{Cp}^{\mathrm{x}}$ ligands performed significantly better in reactivity and enantioselectivity than binaphthyl-derived $\mathrm{Cp}^{\mathrm{x}}$ ligands, the most commonly employed chiral Cp ligands. The product of this transformation, a highly functionalized tricyclic sesquiterpene, has diverse biological activities. The reaction performed well for various substrates, and 18 examples were obtained in very good yields and with very good enantioselectivities up to 97.5:2.5 er. Mechanistic studies were conducted by control experiments as well as computational studies, showing that the reaction mechanism consists of two parts: a ruthenium-catalyzed cycle and a series of pericyclic reactions.

Pericyclic rearrangements

Scheme 6-3: Enantioselective benzonorcaradiene synthesis

The binaphthyl-derived $\mathrm{Cp}^{\times}$Ru complexes showed promising results on the enantioselective alkylative cycloetherification of an allenol 6.11 and a Michael acceptor 6.12 (Scheme 6-4). The transformation is atom economic, forming $\mathrm{C}-\mathrm{O}$ and $\mathrm{C}-\mathrm{C}$ bonds in a single step. The resulting cyclic ethers can be useful precursors for spiroketals. The reaction condition optimization revealed that steric bulk of the substituents on $\mathrm{Cp}^{x}$ ligands has a significant impact on reactivity and enantioselectivity. The transformation showcases the potential of the binaphthyl-derived $\mathrm{Cp}^{\times} \mathrm{Ru}$ complexes for enantioselective catalysis, giving promising results with a high enantioselectivity (90:10 er).

Scheme 6-4: Enantioselective $\mathrm{Cp}^{\times R u}(\mathrm{II})$ catalyzed alkylative cycloetherification.

Preliminary results were also obtained for a [2+1] cycloaddition of enynes. Binaphthyl-derived $\mathrm{Cp} \times \mathrm{Ru}(I I)$ catalysts provided enantio-enriched alkenylbicyclo[3.1.0]hexanes in good yields and with up to 72.5:27.5 er for the E-isomer. The reaction mechanism is similar to olefin metathesis, but the cyclopentadienyl ruthenacyclopentane intermediate undergoes reductive elimination instead of cycloreversion, forming a fused cyclopropane. The substitution patterns on the Cp ring and side walls of $\mathrm{Cp}^{\mathrm{x}}$ ligands affected the diastereoselectivity of alkenyl moiety. These initial results encourage us for further studies on the structures of $\mathrm{Cp}^{\mathrm{x}}$ ligands, which can be key for inducing high diastereoselectivity and enantioselectivity.

Scheme 6-5: Enantioselective $\operatorname{Cp\times Ru}$ (II) catalyzed [2+1] cycloaddition of ruthenium vinyl carbenes

In conclusion, we report a novel class of $\mathrm{Cp}^{\mathrm{x}}$ ligands and the corresponding $\mathrm{Ru}(\mathrm{II})$ complexes. Modification of the cyclopentane-fused $\mathrm{Cp}^{\times} R u(I I)$ catalysts was conducted by changing the side wall aryl substituents and by accessing the respective neutral ruthenium halide complexes. With the novel Cp ${ }^{\times R u}$ catalysts, a catalytic enantioselective synthesis of benzornorcaradienes by coupling of oxabenzonorbornadienes and internal alkynes was established (up to 97.5:2.5 er). The application potential of binaphthyl-derived $\mathrm{Cp}^{\mathrm{x} R u}$ complexes for atom-economic transformations, and their capability for enantio-induction was shown on an alkylative cycloetherification (up to 90:10 er) and a [2+1] cycloaddition of enynes (up to 89:11 er).

Chapter 7 Outlook

Building chiral ligand libraries is important for the discovery of new reactivities and the realization of envisioned catalytic enantioselective approaches. In particular, a novel class of ligand opens up new possibilities for improving the efficiency of reactions or developing complementary synthetic methods. The ruthenium complexes of binaphthyl-derived (7.2) and cyclopentane-fused (7.3) $\mathrm{Cp}^{\mathrm{x}}$ ligands have been applied as a catalysts for enantioselective reactions. There is still a plethora of potential applications of these ligands in ruthenium catalysis. Furthermore, the potential of other $\mathrm{Cp}^{\mathrm{x}}$ classes like cyclohexane-fused $\mathrm{Cp}^{\mathrm{x}}$ (7.1) and biphenyl-derived $\mathrm{Cp}^{\mathrm{x}}$ (7.4), has not yet been explored in $\mathrm{Cp}^{\times} \mathrm{Ru}$ (II) catalysis. These new combinations of $\mathrm{Cp}^{\times}$ligands with ruthenium will give new opportunities for enantioselective catalysis (Figure 7-1). In addition, modifying the sidewalls modulates the reactivity and enantioselectivity of $\mathrm{Cp}^{\times} \mathrm{Ru}(\mathrm{II})$ complexes, which was shown to be key for enhancing the enantioselectivity of an enantioselective ruthenium-catalyzed alkylative cycloetherification.

7.1

7.2

7.3

7.4

Figure 7-1: Four different classes of Cpx ligands.

In addition to the ligand backbone, substitution patterns on the Cp ring constitute an interesting topic for research (Figure 7-2). Establishing a ruthenation method for TMS-substituted $\mathrm{Cp}^{\times}$complexes 7.6 and a penta-substituted $\mathrm{Cp}^{\mathrm{x}}$ complexes 7.7 is desirable, which will broaden the library of available complexes. The substitution pattern on the Cp ring provides an additional handle for catalyst tuning, which can improve the enantio- and diastereoselectivity of the enantioselective [2+1] cycloaddition of ruthenium vinyl carbenes.

Figure 7-2: Various substitution patterns on the Cp ring.

Chapter 8 Experimental Part

### 8.1 General Methods

All reactions were carried out under an atmosphere of nitrogen in oven-dried glassware with magnetic stirring, unless otherwise indicated. THF, $\mathrm{Et}_{2} \mathrm{O}$ and dichloromethane were purified by a Innovative Technology Solvent Delivery System. DMF was dried over 4A molecular sieves. Chemicals were used as obtained from the suppliers unless stated otherwise. Flash chromatography was performed with Silicycle silica gel 60 (0.040-0.063 $\mu \mathrm{m}$ grade) or phosphate buffered silica ( $\mathrm{pH}=7$ ). Analytical thin-layer chromatography was performed with commercially available 0.25 mm silica gel coated on a glass plate (Merck, TLC Silicagel 60 F $_{254}$ ). Compounds were either visualized under UV-light at 254 nm or stained the plates with an aqueous potassium permanganate solution. Proton nuclear magnetic resonance ( ${ }^{1} \mathrm{H}$ NMR) data were acquired at 400 MHz on a Bruker AV400 spectrometer or at 600 MHz on a Bruker AV600 spectrometer. Chemical shifts ( $\delta$ ) are reported in parts per million ( ppm ) relative to residual chloroform ( $\mathrm{s}, 7.26 \mathrm{ppm}$ ) or residual dichloromethane (s, $5.32 \mathrm{ppm})$.1D NOE experiments were performed with a Bruker AV600. Proton decoupled Carbon13 nuclear magnetic resonance ( ${ }^{13} \mathrm{C}$ NMR) data were acquired at 100 MHz on a Bruker AV400 or at 151 MHz on a Bruker AV600 spectrometer. Chemical shifts are reported in ppm relative to residual chloroform ( 77.16 ppm ) or residual dichloromethane ( 53.84 ppm ). Splitting patterns are designated as s, singlet; d, doublet; t, triplet; q, quartet; sept, septet; m, multiplet. All NMR data were recorded at 298 K unless stated otherwise. Infrared (IR) data were recorded on a Bruker Alpha FT-IR Spectrometer. Absorbance frequencies are reported in reciprocal centimeters ( $\mathrm{cm}^{-1}$ ). HRMS measurements were performed on an Agilent LC-MS TOF. High resolution mass are given in $\mathrm{m} / \mathrm{z}$. Enantiomeric excesses were measured on an Agilent HPLC. Optical rotations were measured on a Polartronic M polarimeter using a 0.5 cm cell with a Na 589 nm filter. X-ray analysis was performed by Dr. R. Scopelliti and Dr. F. F. Tirani at the EPF Lausanne.

### 8.2 Synthesis of Chiral $\mathrm{Cp}^{\times}$Ligands and $\mathrm{Cp}^{\times R u}$ (II) Complexes

## Procedures for Preparation of Chiral Bicycle[3.3.0]octatrienes (2.5).

The synthesis of chiral bicycle[3.3.0]octatrienes were accomplished based on the reported procedures. ${ }^{81,122}$

To a solution of (R)-2-(((tert-butyldimethylsilyl)oxy)diphenylmethyl)pyrrolidine ( $10 \mathrm{~mol} \%, 334 \mathrm{mg}$, 0.908 mmol ) and $p$-nitrophenol ( $20 \mathrm{~mol} \%, 253 \mathrm{mg}, 1.82 \mathrm{mmol}$ ) in $\mathrm{MeOH} / \mathrm{DCM}(9.1 \mathrm{~mL} / 9.1 \mathrm{~mL}$ ) was added $\alpha, \beta$-unsaturatedaldehyde ( 9.08 mmol ) at room temperature under $\mathrm{N}_{2}$. The mixture was stirred for 1 min before the addition of cyclopentadiene ( $2.29 \mathrm{~mL}, 3$ equiv., 27.2 mmol ). After stirring the reaction mixture for 20 h at room temperature, excess cyclopentadiene was azeotropically removed with toluene from the reaction mixture. To the solution of crude mixture in $\mathrm{MeOH} / \mathrm{DCM}(3 \mathrm{~mL} / 3 \mathrm{~mL})$ were added $p$-nitrophenol ( 1.26 mg , 1 equiv., 9.08 mmol ) and diisobutylamine ( $2.38 \mathrm{~mL}, 1.5$ equiv., 13.6 mmol ) at room temperature. The obtained solution was stirred for 24 h under $\mathrm{N}_{2}$. The resulting mixture was quenched with pH 7.0 phosphate buffer. The organic layer was extracted with EtOAc (3 $\times 40 \mathrm{~mL}$ ), the combined organic layer was washed with brine, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and filtrated. After the solvent was removed under reduced pressure, the residue was purified by silica gel column chromatography ( $n$-pentane to $n$-pentane/EtOAc $=100 / 1 / 1$ to $n$-pentane/EtOAc/DCM $=50 / 1 / 1$ ) to afford the product 2.5.

(R)-1-Phenyl-1,2-dihydropentalene (2.5)

Orange solid, $669 \mathrm{mg}, 41 \%$ yield (Over two steps); 98.5:1.5 er. [ $\alpha]_{D_{0}}{ }^{20}-60.2$ (c $0.44, \mathrm{CH}_{2} \mathrm{Cl}_{2}$ ); Analytical data: ${ }^{1} \mathrm{H}$ NMR ( 400 MHz , Benzene- $d_{6}$ ) $\delta 7.14$ - 7.07 (m, 3H), $7.07-7.02$ (m, 1H), 6.86 (dd, $J=5.2,1.8 \mathrm{~Hz}, 1 \mathrm{H}), 6.37-6.19(\mathrm{~m}, 2 \mathrm{H}), 5.91(\mathrm{q}, J=2.0 \mathrm{~Hz}, 1 \mathrm{H}), 3.93(\mathrm{dt}, J=6.8,2.3 \mathrm{~Hz}, 1 \mathrm{H})$,
3.15 (ddd, $J=19.9,6.6,2.8 \mathrm{~Hz}, 1 \mathrm{H})$, $2.66(\mathrm{dt}, J=19.9,2.5 \mathrm{~Hz}, 1 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR $\left(101 \mathrm{MHz}, \mathrm{C}_{6} \mathrm{D}_{6}\right) \delta$ $154.28,153.86,145.01,142.58,140.29,128.82,127.62,126.53,117.09,112.82,51.75,42.56$.The enantiomeric excess was determined by Daicel Chiralpak IB ( 25 cm ), Hexanes/IPA $=99 / 1,1.0$ $\mathrm{mL} / \mathrm{min}^{-1}, \lambda=254 \mathrm{~nm}, \mathrm{t}_{\mathrm{R}}$ (major) $=5.17 \mathrm{~min}, \mathrm{t}_{\mathrm{R}}$ (minor) $=4.53 \mathrm{~min}$. After crystallization in pentane and ether, $\mathbf{2} .5$ was obtained with $>99.5: 0.5$ er.

## General Procedures for Preparation of Chiral Ligands (2.7).

The freshly prepared Ph-Li solution ( 5 equiv., 6.7 mmol in $6.7 \mathrm{~mL} \mathrm{Et}_{2} \mathrm{O}$ ) in $\mathrm{Et}_{2} \mathrm{O}$ was added slowly to a solution of corresponding $(R)$-1-Phenyl-1,2-dihydropentalene ( 1.34 mmol ) in anhydrous $\mathrm{Et}_{2} \mathrm{O}$ (11 mL ) and benzene ( 4.4 mL ) at $-40^{\circ} \mathrm{C}$. The reaction was stirred at $-40^{\circ} \mathrm{C}$, and allowed to warm up slowly. After the reaction was complete (monitored by TLC), at the time, the temperature became $18{ }^{\circ} \mathrm{C}$. Then, the reaction mixture was stirred at $0{ }^{\circ} \mathrm{C}$ and quenched with water. The organic layer was extracted with ether ( $3 \times 30 \mathrm{~mL}$ ). The combined organic layer was dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and filtered. After the solvent was removed under reduced pressure, the residue was purified through silica gel ( PE to $\mathrm{PE} / \mathrm{Et}_{2} \mathrm{O} 100 / 1$ ) giving the desired product as a mixture of $\mathrm{C} p^{\mathrm{x}}$ compounds.

Pale yellow gum, $267 \mathrm{mg}, 6.8: 1$ ratio of double bond isomers, $75 \%$ yield. Analytical data for major isomer 2.7: ${ }^{1} \mathrm{H}$ NMR (400 MHz, Chloroform-d) $\delta 7.30(\mathrm{~m}, 5 \mathrm{H}), 7.24-7.13$ (m, 5H), 6.47 (d, $J=5.4 \mathrm{~Hz}, 1 \mathrm{H}), 6.38(\mathrm{dt}, J=5.3,1.8 \mathrm{~Hz}, 1 \mathrm{H}), 4.28-4.15$ (m, 2H), $2.96-2.78$ (m, 2H), 2.75 (ddd, $J=7.6,5.7,2.0 \mathrm{~Hz}$, $2 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $101 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 153.22,152.84,146.44,145.62,136.77,129.27,128.64,128.52$, 127.74, 127.45, 127.31, 126.26, 51.36, 47.81, 46.42, 36.90. HRMS (ESI) calcd for $\mathrm{C}_{20} \mathrm{H}_{19}{ }^{+}$: $[\mathrm{M}+\mathrm{H}]^{+}$: 259.1481, Found: 259.1486.

## General Procedures for the Syntheses of $\left[\mathrm{Cp}^{\times} \mathrm{Ru}\left(\mathrm{C}_{6} \mathrm{H}_{6}\right)\right] \mathrm{Cl}$ Complexes (Ru.3a)

In a dry Schlenk tube, the mixture of ligand isomers 2.7 and 2.7 ( $400 \mathrm{mg}, 1.548 \mathrm{mmol}$ ) were dissolved in degassed benzene ( 8 mL ) under $\mathrm{N}_{2}$. TIOEt ( $425 \mathrm{mg}, 1.1$ equiv., 1.703 mmol ) dissolved
in benzene ( 2 mL ) was injected to Schlenk tube. The obtained mixture was stirred under $\mathrm{N}_{2}$ at room temperature and protected from light for 16 h . The obtained brown TICp-suspension was added to a suspension of $\left[\left(\mathrm{C}_{6} \mathrm{H}_{6}\right) \mathrm{RuCl}_{2}\right]_{2}(426 \mathrm{mg}, 0.55$ equiv., 0.852 mmol$)$ in 45 ml degassed acetonitrile. The mixture was stirred under $\mathrm{N}_{2}$ at room temperature in the dark for 24 h . The brown mixture was filtered through a short pad of celite and washed with DCM. After the solvent was removed under reduced pressure, the residue was purified by acidic alumina column chromatography (DCM to DCM/MeOH $=30 / 1$ ) to afford the product Ru.3a.

Brown foam, 700 mg , $96 \%$ yield. $[\alpha]_{D^{20}}-32.2\left(c 0.44, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right)$; Analytical data Ru.3aa, ${ }^{1} \mathrm{H}$ NMR (400 MHz , Chloroform-d) $\delta 7.42(\mathrm{t}, J=7.5 \mathrm{~Hz}, 2 \mathrm{H}), 7.30(\mathrm{dd}, J=14.7,7.6 \mathrm{~Hz}, 4 \mathrm{H}), 7.24(\mathrm{~s}, 1 \mathrm{H}), 7.19(\mathrm{t}$, $J=7.2 \mathrm{~Hz}, 1 \mathrm{H}$ ), 7.10 (d, $J=7.5 \mathrm{~Hz}, 2 \mathrm{H}), 6.05$ (s, 6H), 5.59 (s, 1H), 5.43 (s, 1H), 5.40 (s, 1H), 4.40 (d, $J=7.9 \mathrm{~Hz}, 1 \mathrm{H}$ ), $4.18(\mathrm{dd}, J=10.5,6.9 \mathrm{~Hz}, 1 \mathrm{H}), 3.03(\mathrm{td}, J=12.0,8.1 \mathrm{~Hz}, 1 \mathrm{H}), 2.76(\mathrm{dd}, J=12.8$, $7.0 \mathrm{~Hz}, 1 \mathrm{H}$ ). ${ }^{13} \mathrm{C}$ NMR ( 101 MHz , Chloroform-d) $\delta 141.81,140.31,128.97,127.53,127.25,126.83$, 126.37, 113.29, 111.84, 87.38, 84.33, 74.40, 43.49, 42.38, 39.75. ## General Procedures for Counteranion Exchange of Chiral [ $\left.\mathrm{Cp}{ }^{\times} \mathrm{Ru}\left(\mathrm{C}_{6} \mathrm{H}_{6}\right)\right] \mathrm{Cl}$ Complexes (Ru.3a)

To a solution of obtained complex Ru.3a (1 equiv.) in dry DCM at room temperature was added a solution of $\mathrm{AgPF}_{6}$ ( 1.20 equiv.) in dry DCM under $\mathrm{N}_{2}$. The mixture was stirred for 15-30 min at room temperature in the dark. AgCl was removed by filtration over paper and all volatiles removed under
reduced pressure. The residue was purified by acidic aluminia column chromatography (DCM to $\mathrm{DCM} / \mathrm{MeOH}=30 / 1$ ) to afford the product Ru.3b.

Brown foam, 109 mg , 97\% yield; Analytical data Ru.3ba, $[\alpha]_{D^{20}}-26.3\left(c 1.0, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right) ; \mathrm{Mp}=196.7-$ $197.5^{\circ} \mathrm{C}$; Analytical data Ru.3ba: ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CD}_{2} \mathrm{Cl}_{2}$ ) $\delta 7.46(\mathrm{t}, \mathrm{J}=7.5 \mathrm{~Hz}, 2 \mathrm{H}), 7.37(\mathrm{~d}, J=$ $7.6 \mathrm{~Hz}, 1 \mathrm{H}), 7.35-7.28(\mathrm{~m}, 4 \mathrm{H}), 7.27-7.22(\mathrm{~m}, 1 \mathrm{H}), 7.15-7.10(\mathrm{~m}, 2 \mathrm{H}), 5.83(\mathrm{~s}, 6 \mathrm{H}), 5.38(\mathrm{~d}, \mathrm{~J}=$ $1.4 \mathrm{~Hz}, 2 \mathrm{H}), 5.31-5.30(\mathrm{t}, J=1.1 \mathrm{~Hz}, 1 \mathrm{H}), 4.25(\mathrm{dd}, J=10.5,7.1 \mathrm{~Hz}, 1 \mathrm{H}), 4.17(\mathrm{~d}, J=8.0 \mathrm{~Hz}, 1 \mathrm{H})$, 2.95 (ddd, $J=12.9,10.5,8.0 \mathrm{~Hz}, 1 \mathrm{H}), 2.80(\mathrm{dd}, J=12.9,7.1 \mathrm{~Hz}, 1 \mathrm{H}) .{ }^{13} \mathrm{C} \mathbf{N M R}\left(100 \mathrm{MHz}, \mathrm{CD}_{2} \mathrm{Cl}_{2}\right)$ $\delta 142.12,140.64,129.30,129.27,127.85,127.62,127.03,126.57,114.07,112.36,86.98,83.65$, $74.66,74.64,43.63,42.65,40.02 .{ }^{19} \mathrm{~F}$ NMR ( $376 \mathrm{MHz}, \mathrm{CD}_{2} \mathrm{Cl}_{2}$ ) $\delta-72.73(\mathrm{~d}, J=711.3 \mathrm{~Hz}) .{ }^{31} \mathrm{P}$ NMR ( $162 \mathrm{MHz}, \mathrm{CD}_{2} \mathrm{Cl}_{2}$ ) $\delta-144.37$ (hept, $J=711.2 \mathrm{~Hz}$ ). ## Procedures for the Synthesis of the Active Complex (Ru.4b)

A solution of complex Ru.3b ( $0.029 \mathrm{mmol}, 1$ equiv.) in degassed acetonitrile ( 0.02 M ) transferred to a photochemical reactor (ACE glass, PenRay © low-pressure mercury lamp, 5.5 Watts, 254 nm wavelength). The system was closed and irradiated for 24 h under nitrogen purging. The reaction mixture turned to yellow from colorless solution. The resulting solution was concentrated under reduced pressure. In order to remove residual volatiles, freeze-dry using liquid $\mathrm{N}_{2}$ and high vacuum was used. After removing volatiles, it produced corresponding trisacetonitrile Ru.4b as a brown foam.

Brown foam, $17.8 \mathrm{mg}, 100 \%$ yield; Analytical data Ru.4ba, [ $\alpha]_{\mathrm{D}}{ }^{20}-25.9$ (c 0.8, $\mathrm{CH}_{3} \mathrm{CN}$ );: ${ }^{1} \mathrm{H}$ NMR ( $600 \mathrm{MHz}, \mathrm{CD}_{3} \mathrm{CN}$ ) ठ $7.47-7.43(\mathrm{~m}, 2 \mathrm{H}), 7.37(\mathrm{t}, \mathrm{J}=7.7 \mathrm{~Hz}, 2 \mathrm{H}), 7.32-7.28(\mathrm{~m}, 2 \mathrm{H}), 7.25(\mathrm{~d}, \mathrm{~J}=$ $7.4 \mathrm{~Hz}, 1 \mathrm{H}), 7.22(\mathrm{~d}, \mathrm{~J}=8.0 \mathrm{~Hz}, 3 \mathrm{H}), 4.36(\mathrm{t}, \mathrm{J}=2.2 \mathrm{~Hz}, 1 \mathrm{H}), 4.14(\mathrm{~d}, \mathrm{~J}=2.3 \mathrm{~Hz}, 1 \mathrm{H}), 3.97(\mathrm{dd}, \mathrm{J}=$ $10.9,6.7 \mathrm{~Hz}, 1 \mathrm{H}$ ), $3.87-3.84(\mathrm{~m}, 2 \mathrm{H}), 2.93$ (ddd, J = 12.3, 10.9, 8.1 Hz, 1H), 2.53 (dd, J=12.3, 6.6 $\mathrm{Hz}, 1 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $151 \mathrm{MHz}, \mathrm{CD}_{3} \mathrm{CN}$ ) $\delta$ 144.10, 141.64, 129.54, 129.08, 128.64, 128.00, 127.51, 127.48, 102.73, 95.35, 78.50, 61.76, 55.17, 44.22, 42.20, 40.82. ${ }^{19} \mathrm{~F}$ NMR ( $376 \mathrm{MHz}, \mathrm{CD}_{3} \mathrm{CN}$ ) $\delta$ 72.87 ( $\mathrm{d}, J=706.4 \mathrm{~Hz}$ ). ${ }^{31} \mathrm{P}$ NMR ( $243 \mathrm{MHz}, \mathrm{CD}_{3} \mathrm{CN}$ ) $\delta-143.18$ (hept, $J=707.1 \mathrm{~Hz}$ ). IR (ATR): $\mathrm{v}_{\max }$ $\left(\mathrm{cm}^{-1}\right)=3088$, $3057,3028,2936,1652,1601,1496,1449,1031,836,763,703,558$, HRMS (ESI) calcd for $\left[\mathrm{C}_{20} \mathrm{H}_{17} \mathrm{Ru}\right]^{+}: 359.0368$, Found: 359.0360.

## Procedures for the Synthesis of Neutral CpxRuX Complexes (Ru.6a and Ru.6b).

A solution of Ru.4ba (1 equiv.) and tetrabutylammonium chloride (1.1 equiv.) was dissolved in DCM. Then, freshly distilled norbornadiene ( 10 equiv.) was added into the reaction mixture. Stirred the reaction mixture for 15 h , then, all volatiles were removed under reduced pressure. The crude mixture was purified by silica column chromatography (DCM to $n$-pentane/EA $=3 / 1\left(\mathrm{v} / \mathrm{v}^{\prime}\right)$ ).

Brown foam, 2.64 mg , 47\% yield; Analytical data Ru.6a, $[\alpha]_{\mathrm{D}}{ }^{20}+103.3$ ( $\mathrm{c}=0.1, \mathrm{CH}_{2} \mathrm{Cl}_{2}$ );: ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CD}_{2} \mathrm{Cl}_{2}$ ) $\delta(\mathrm{ppm}) 7.36-7.27(\mathrm{~m}, 4 \mathrm{H}), 7.23(\mathrm{dd}, \mathrm{J}=11.2,6.4 \mathrm{~Hz}, 4 \mathrm{H}), 7.18(\mathrm{~d}, \mathrm{~J}=7.7 \mathrm{~Hz}$, 2H), 5.04 (s, 1H), $4.70(\mathrm{~d}, \mathrm{~J}=2.9 \mathrm{~Hz}, 2 \mathrm{H}), 4.54-4.45(\mathrm{~m}, 1 \mathrm{H}), 4.22(\mathrm{~d}, \mathrm{~J}=6.3 \mathrm{~Hz}, 2 \mathrm{H}), 4.13(\mathrm{~d}, \mathrm{~J}=$ $2.6 \mathrm{~Hz}, 1 \mathrm{H}), 4.07$ (d, J = $8.1 \mathrm{~Hz}, 1 \mathrm{H}), 3.58$ (s, 1H), $3.56-3.52(\mathrm{~m}, 1 \mathrm{H}), 3.35(\mathrm{~s}, 1 \mathrm{H}), 2.75(\mathrm{td}, \mathrm{J}=$ 11.4, 8.2 Hz, 1H), 2.29 (dd, J = 12.4, 6.7 Hz, 1H), 1.22 (d, J = $8.0 \mathrm{~Hz}, 1 \mathrm{H}$ ), 1.14 (d, J = $8.7 \mathrm{~Hz}, 1 \mathrm{H}$ ). ${ }^{13}$ C NMR ( $151 \mathrm{MHz}, \mathrm{CD}_{2} \mathrm{Cl}_{2}$ ) $\delta(\mathrm{ppm})=143.25,140.23,128.90,128.63,127.92,127.61,127.17$, $126.78,122.37,111.17,90.17,76.16,73.21,71.25,65.30,62.73,50.69,50.32,49.43,48.54,42.60$, 42.07, 1.16. ## General Procedure for the Synthesis of Chiral Cp×Ru Complexes

The $\mathrm{Cp}^{\mathrm{x}}$ ligand 2.13 (mixture of isomers, $106 \mu \mathrm{~mol}, 1.00 \mathrm{eq}$.) was dissolved in benzene ( 1.00 mL , degassed by pump-freeze-thaw, 3 cycles). Then, thallium ethoxide ( $117 \mu \mathrm{~mol}, 1.10 \mathrm{eq}$.) was added as a solution in degassed benzene ( 0.50 mL ) under nitrogen atmosphere under the absence of light at room temperature. The mixture was stirred the mixture at room temperature for 12 h or it was heated to $80^{\circ} \mathrm{C}$ for shortening the reaction time for deprotonation of Cp ligands. After cooling back to room temperature the resulting brown solution was added dropwise to a suspension of $\left[\mathrm{Ru}\left(\mathrm{C}_{6} \mathrm{H}_{6}\right) \mathrm{Cl}_{2}\right]_{2}(63.0 \mu \mathrm{~mol}, 0.60 \mathrm{eq}$.) in 8.00 mL degassed acetonitrile. The resulting mixture was stirred for 18 h protected from light. TICI was removed by filtration over Kimtech paper and all volatiles were removed under reduced pressure. The residue was dissolved in 1.00 ml MeOH and filtered again over a pipette filled with paper, washed with $\mathrm{MeOH}(3 \times 1 \mathrm{~mL})$ to remove insoluble impurities and ruthenocene ( $\mathbf{C p}{ }_{2} \mathbf{R} \mathbf{R u}$ ) byproducts. The filtrate was evaporated to dryness and purified by column chromatography on acidic alumina (changing the gradient form pure DCM to DCM/MeOH $\left.=50 / 1\left(\mathrm{v} / \mathrm{v}^{\prime}\right)\right)$ to yield sandwich complex with chloride counter anion Ru.1a as brown solid.

$R=T B D P S$

Following the general procedure using 60 mg ( 0.070 mmol ) of corresponding $\mathrm{Cp}^{\mathrm{x}}$ ligand. Stirred the $\mathrm{Cp}^{\mathrm{x}}$ ligand with thallium ethoxide at $80^{\circ} \mathrm{C}$ for 3 h for the deprotonation.

Pale yellow solid, $12 \mathrm{mg}, 16 \%$ yield; Analytical data Ru.1ab: ${ }^{1} \mathbf{H} \mathbf{N M R}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.86$ 7.78 (m, 2H), $7.75-7.68(\mathrm{~m}, 2 \mathrm{H}), 7.63$ (ddd, $J=8.1,2.7,1.3 \mathrm{~Hz}, 4 \mathrm{H}), 7.59-7.49(\mathrm{~m}, 4 \mathrm{H}), 7.48-$ 7.41 (m, 4H), 7.36 (dtd, $J=11.6,7.5,5.3 \mathrm{~Hz}, 7 \mathrm{H}), 7.20$ (ddd, $J=14.8,7.7,1.3 \mathrm{~Hz}, 2 \mathrm{H}), 7.13$ (ddd, $J=8.2,6.8,1.2 \mathrm{~Hz}, 1 \mathrm{H}), 6.98(\mathrm{ddd}, J=8.3,6.5,1.5 \mathrm{~Hz}, 1 \mathrm{H}), 6.92(\mathrm{~s}, 1 \mathrm{H}), 6.88(\mathrm{~d}, J=8.4 \mathrm{~Hz}, 1 \mathrm{H})$, $6.51-6.44(\mathrm{~m}, 1 \mathrm{H}), 6.07(\mathrm{~s}, 6 \mathrm{H}), 5.72(\mathrm{~s}, 1 \mathrm{H}), 5.44(\mathrm{~s}, 1 \mathrm{H}), 5.20(\mathrm{~s}, 1 \mathrm{H}), 4.15(\mathrm{~d}, \mathrm{~J}=13.9 \mathrm{~Hz}, 1 \mathrm{H})$, $4.04(\mathrm{~d}, J=15.0 \mathrm{~Hz}, 1 \mathrm{H}), 3.13(\mathrm{~d}, J=13.9 \mathrm{~Hz}, 1 \mathrm{H}), 2.88(\mathrm{~d}, J=15.1 \mathrm{~Hz}, 1 \mathrm{H}), 1.25(\mathrm{~s}, 9 \mathrm{H}), 1.17(\mathrm{~s}$, 9H).

Following the general procedure using 72.9 mg ( 0.106 mmol ) of corresponding $\mathrm{Cp}^{\mathrm{x}}$ ligand. Stirred the $\mathrm{Cp}{ }^{\mathrm{x}}$ ligand with thallium ethoxide at room temperature for 12 h for the deprotonation.

Yellow solid, $34 \mathrm{mg}, 35 \%$ yield; Analytical data Ru.1ac: ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) 7.84 (d, J=8.2 $\mathrm{Hz}, 1 \mathrm{H}), 7.71(\mathrm{~d}, J=8.2 \mathrm{~Hz}, 1 \mathrm{H}), 7.56(\mathrm{~s}, 1 \mathrm{H}), 7.48(\mathrm{ddd}, J=8.1,6.8,1.2 \mathrm{~Hz}, 1 \mathrm{H}), 7.36(\mathrm{ddd}, J=$ $8.1,6.8,1.2 \mathrm{~Hz}, 1 \mathrm{H}), 7.27(\mathrm{~s}, 1 \mathrm{H}), 7.18$ (ddd, $J=8.3,6.9,1.2 \mathrm{~Hz}, 1 \mathrm{H}), 7.08-6.96(\mathrm{~m}, 2 \mathrm{H}), 6.73(\mathrm{~d}$, $J=8.5 \mathrm{~Hz}, 1 \mathrm{H}), 6.03(\mathrm{~s}, 6 \mathrm{H}), 5.75(\mathrm{~s}, 1 \mathrm{H}), 5.44(\mathrm{~s}, 1 \mathrm{H}), 5.12(\mathrm{~s}, 1 \mathrm{H}), 3.93(\mathrm{dd}, J=14.4,10.8 \mathrm{~Hz}$, $2 \mathrm{H}), 3.02(\mathrm{~d}, J=13.9 \mathrm{~Hz}, 1 \mathrm{H}), 2.91(\mathrm{~d}, J=14.9 \mathrm{~Hz}, 1 \mathrm{H}), 1.43(\mathrm{~h}, J=7.4 \mathrm{~Hz}, 6 \mathrm{H}), 1.23(\mathrm{~d}, J=7.5$ Hz, 9H), $1.19-1.11$ (m, 27H).

Following the general procedure using 14.6 mg ( 0.039 mmol ) of corresponding $\mathrm{Cp}^{\mathrm{x}}$ ligand. Stirred the $\mathrm{Cp}^{\mathrm{x}}$ ligand with thallium ethoxide at room temperature for 12 h for the deprotonation.

White solid, $1.5 \mathrm{mg}, 7 \%$ yield; Analytical data Ru.1ae: ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CD}_{3} \mathrm{OD}$ ) $\overline{\mathrm{D}} 7.81$ (d, $\mathrm{J}=8.3$ $\mathrm{Hz}, 1 \mathrm{H}), 7.68$ (s, 1H), 7.51 (s, 1H), $7.43-7.36$ (m, 1H), $7.36-7.29(\mathrm{~m}, 1 \mathrm{H}), 7.26(\mathrm{~s}, 1 \mathrm{H}), 7.10-$ 6.98 (m, 2H), 6.88 (dd, $J=17.3,8.4 \mathrm{~Hz}, 2 \mathrm{H}), 6.01(\mathrm{~s}, 6 \mathrm{H}), 5.49(\mathrm{~s}, 1 \mathrm{H}), 5.34(\mathrm{~d}, J=2.4 \mathrm{~Hz}, 1 \mathrm{H}), 5.19$ (t, $J=2.4 \mathrm{~Hz}, 1 \mathrm{H}), 4.05(\mathrm{~d}, J=15.3 \mathrm{~Hz}, 1 \mathrm{H}), 3.90(\mathrm{~d}, J=13.7 \mathrm{~Hz}, 1 \mathrm{H}), 3.02(\mathrm{~d}, J=13.7 \mathrm{~Hz}, 1 \mathrm{H})$, $2.83(\mathrm{~d}, \mathrm{~J}=15.3 \mathrm{~Hz}, 1 \mathrm{H})$.

## 

To a solution of obtained $\left[\mathrm{Cp}^{\times} \mathrm{Ru}\left(\mathrm{C}_{6} \mathrm{H}_{6}\right)\right] \mathrm{Cl}$ complex Ru1a (1 equiv.) in dry DCM at room temperature was added a solution of $\mathrm{AgPF}_{6}$ ( 1.20 equiv.) in dry DCM under $\mathrm{N}_{2}$. The mixture was stirred for 15-30 min at room temperature in the dark. AgCl was removed by filtration over paper and all volatiles removed under reduced pressure. The residue was purified by acidic aluminia column chromatography (DCM to $\mathrm{DCM} / \mathrm{MeOH}=30 / 1$ ) to afford the product 4.

$R=T B D P S$

Brown solid 7.3 mg , 94\% yield; Analytical data Ru.1bb: ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.84-7.75$ (m, 2H), 7.72 (dd, $J=8.1,1.4 \mathrm{~Hz}, 2 \mathrm{H}$ ), 7.64 (td, $J=8.3,1.4 \mathrm{~Hz}, 4 \mathrm{H}$ ), $7.59-7.54$ (m, 2H), $7.54-7.50$ (m, 2H), $7.48-7.42$ (m, 4H), $7.42-7.32(m, 8 H), 7.21$ (ddd, $J=8.2,6.6,1.2 \mathrm{~Hz}, 1 \mathrm{H}), 7.14$ (ddd, J $=8.2,6.8,1.3 \mathrm{~Hz}, 1 \mathrm{H}$ ), 6.99 (ddd, $J=8.3,6.6,1.5 \mathrm{~Hz}, 1 \mathrm{H}), 6.94(\mathrm{~s}, 1 \mathrm{H}), 6.90(\mathrm{dd}, J=8.4,1.1 \mathrm{~Hz}$, $1 \mathrm{H}), 6.49$ (dd, $J=8.5,1.1 \mathrm{~Hz}, 1 \mathrm{H}), 5.94$ (s, 6H), 5.38 (d, $J=2.4 \mathrm{~Hz}, 1 \mathrm{H}), 5.37-5.33(\mathrm{~m}, 1 \mathrm{H}), 5.19$ (t, $J=1.7 \mathrm{~Hz}, 1 \mathrm{H}), 4.13(\mathrm{~d}, J=14.0 \mathrm{~Hz}, 1 \mathrm{H}), 4.04(\mathrm{~d}, J=15.1 \mathrm{~Hz}, 1 \mathrm{H}), 3.10(\mathrm{~d}, J=14.0 \mathrm{~Hz}, 1 \mathrm{H})$, $2.88(\mathrm{~d}, \mathrm{~J}=15.1 \mathrm{~Hz}, 1 \mathrm{H}), 1.26(\mathrm{~s}, 9 \mathrm{H}), 1.18(\mathrm{~s}, 9 \mathrm{H}) .{ }^{31} \mathbf{P}$ NMR ( $162 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta-129.73,-135.56$, -139.96, -144.36, -148.76, -153.16, -157.56.

Yellow solid, 15 mg , $75 \%$ yield; Analytical data Ru.1bc: ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.84$ (d, $J=$ $8.2 \mathrm{~Hz}, 1 \mathrm{H}$ ), 7.71 (d, $J=8.2 \mathrm{~Hz}, 1 \mathrm{H}$ ), 7.57 (s, 1H), 7.49 (ddd, $J=8.1,6.8,1.1 \mathrm{~Hz}, 1 \mathrm{H}), 7.36$ (ddd, J $=8.1,6.7,1.1 \mathrm{~Hz}, 1 \mathrm{H}), 7.28(\mathrm{~s}, 1 \mathrm{H}), 7.19$ (ddd, $J=8.2,6.8,1.2 \mathrm{~Hz}, 1 \mathrm{H}), 7.09-6.98$ (m, 2H), 6.74 (d, $J=8.5 \mathrm{~Hz}, 1 \mathrm{H}), 5.91(\mathrm{~s}, 6 \mathrm{H}), 5.43(\mathrm{~s}, 1 \mathrm{H}), 5.34(\mathrm{t}, J=2.5 \mathrm{~Hz}, 1 \mathrm{H}), 5.14(\mathrm{~s}, 1 \mathrm{H}), 3.95(\mathrm{dd}, J=$ $14.5,7.5 \mathrm{~Hz}, 2 \mathrm{H}), 3.01$ (d, $J=13.9 \mathrm{~Hz}, 1 \mathrm{H}), 2.92(\mathrm{~d}, J=14.9 \mathrm{~Hz}, 1 \mathrm{H}), 1.44(\mathrm{~h}, J=7.5 \mathrm{~Hz}, 6 \mathrm{H}), 1.24$ (d, $J=7.5 \mathrm{~Hz}, 9 \mathrm{H}), 1.20-1.10(\mathrm{~m}, 27 \mathrm{H}) .{ }^{31} \mathrm{P}$ NMR ( $162 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta-131.21,-135.60,-140.01,-$ 144.40, -144.42, -148.81, -153.20, -157.60.

## Procedures for the Deprotection of Silyloxy group on [Cp $\left.{ }^{\mathrm{x} R u}\left(\mathrm{C}_{6} \mathrm{H}_{6}\right)\right] \mathrm{PF}_{6}$ Complexes (Ru.1bc)

The ruthenium complex Ru.1bc ( $4.02 \mathrm{mg}, 3.97 \mu \mathrm{~mol}, 1.0$ equiv.) was suspended in DMF. To the mixture was added tetrabutylammonium fluoride ( $8.34 \mu \mathrm{l}, 8.34 \mu \mathrm{~mol}, 2.1$ equiv.) as a 1.00 M solution in THF. Stirred the reaction mixture at room temperature for 20 h , then, the reaction mixture was concentrated under reduced pressure. The crude product was filtered through Kimtech paper using chloroform. The filtered solid contained the desired Ru.1be and excess amount of Bu4NF was dissolved in the filtrate. The filtered solid can be dissolved in methanol, which was purified by acidic alumina column chromatography (DCM to DCM/MeOH = 10/1 (v/v')).

white solid, 2.7 mg , $99 \%$ yield; Analytical data Ru.1be: ${ }^{1} \mathbf{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CD}_{3} \mathrm{OD}$ ) $\delta 7.79$ (d, $J=$ $8.2 \mathrm{~Hz}, 1 \mathrm{H}$ ), 7.68 (d, $J=8.2 \mathrm{~Hz}, 1 \mathrm{H}$ ), $7.50(\mathrm{~s}, 1 \mathrm{H}), 7.38$ (ddd, $J=8.1,6.8,1.2 \mathrm{~Hz}, 1 \mathrm{H}$ ), 7.31 (ddd, $J$ $=8.2,6.8,1.3 \mathrm{~Hz}, 1 \mathrm{H}), 7.25(\mathrm{~s}, 1 \mathrm{H}), 7.02$ (dddd, $J=15.1,8.2,6.8,1.3 \mathrm{~Hz}, 2 \mathrm{H}), 6.93-6.82(\mathrm{~m}, 2 \mathrm{H})$, 6.01 (s, 6H), $5.51-5.45(\mathrm{~m}, 1 \mathrm{H}), 5.37-5.30(\mathrm{~m}, 1 \mathrm{H}), 5.18(\mathrm{t}, \mathrm{J}=2.4 \mathrm{~Hz}, 1 \mathrm{H}), 4.05(\mathrm{~d}, J=15.2 \mathrm{~Hz}$, $1 \mathrm{H}), 3.90(\mathrm{~d}, J=13.8 \mathrm{~Hz}, 1 \mathrm{H}), 3.02(\mathrm{~d}, J=13.7 \mathrm{~Hz}, 1 \mathrm{H}), 2.82(\mathrm{~d}, J=15.3 \mathrm{~Hz}, 1 \mathrm{H})$.

## X-ray structures of Ru.3ba

Ru.3ba

## X-ray structures of Ru.3bc

Ru.3bc

Crystallographic data: CCDC 1816539 for Ru.3ba, 1816540 for Ru.3bc contain the supplementary crystallographic data for this paper. These data can be obtained free of charge from The Cambridge Crystallographic Data Centre via www.ccdc.cam.ac.uk/data_request/cif.

### 8.3 Enantioselective Ruthenium(II)-Catalyzed Synthesis of Benzonorcaradienes

## Preparation of phosphate buffered silica ( $\mathrm{pH}=7$ )

To 100 g of silica (Silicycle silica gel 60) was added 1 L of disodium hydrogen phosphate (aq, 0.2 $\mathrm{M})$. The pH of the mixture was adjusted to 7 by adding phosphoric acid. The mixture was filtered and the resulting silica was dried in the oven.

## Preparation of chiral $\mathbf{C p}{ }^{\mathrm{x}} \mathrm{Ru}$ complexes

Cyclopentane-derived $\mathrm{Cp}^{\times} \mathrm{Ru}(\mathrm{II})\left(\mathrm{CH}_{3} \mathrm{CN}\right)_{3} \mathrm{PF}_{6}$ complexes Ru.2b were prepared by following the procedures mentioned in Chapter 8.2, and binaphthyl-derived $\mathrm{Cp} \times \mathrm{Ru}(\mathrm{II})$ complexes Ru.2ba and Ru.2bf ${ }^{65 a}, 65 \mathrm{c}$ were prepared according to the reported procedures.

## Preparation of oxa-benzonorbornadienes and alkynes

But-2-yne-1,4-diol was purified by flash column chromatography and hept-2-yn-1-ol was distilled with a Hickman condenser prior to use.

The following compounds were prepared according to the published procedures.
6,7-Dimethoxy-1,4-dihydro-1,4-epoxynaphthalene (3.13b), ${ }^{123}$ 5,8-dimethoxy-1,4-dihydro-1,4epoxynaphthalene (3.13c), ${ }^{124}$ 6,7-dimethyl-1,4-dihydro-1,4-epoxynaphthalene (3.13d), ${ }^{125}$ 6,7-dibromo-1,4-dihydro-1,4-epoxynaphthalene (3.13e), ${ }^{126}$ but-2-yne-1,4-diyl dimethyl bis(carbonate) (3.14c), ${ }^{127}$ but-2-yne-1,4-diyl di-tert-butyl bis(carbonate) (3.14d), ${ }^{125}$ dibenzyl but-2-yne-1,4-diyl bis(carbonate) (3.14e), ${ }^{125}$ but-2-yne-1,4-diyl bis(phenylcarbamate) (3.14f), ${ }^{128}$ but-2-yne-1,4-diyl dibenzoate ( $\mathbf{3 . 1 4 g}$ ), ${ }^{129}$ but-2-yne-1,4-diyl diacetate ( $\mathbf{3 . 1 4 h}$ ), ${ }^{130} 2,2,3,3,10,10,11,11$-octamethyl-4,9-dioxa-3,10-disiladodec-6-yne (3.14i), , ${ }^{131}$ 1,4-bis(benzyloxy)but-2-yne (3.14j), ${ }^{125}$ hept-2-yn-1-yl methyl carbonate (3.14I), ${ }^{132}$ 6-phenylhex-2-yn-1-ol (3.14n), ${ }^{133} 4$-hydroxybut-2-yn-1-yl methyl carbonate (3.140). ${ }^{134}$

White solid, 430 mg , $62 \%$ yield; Analytical data: ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.05(\mathrm{~s}, 2 \mathrm{H}), 6.97$ (s, 2H), 5.68 (s, 2H), 3.85 (s, 6H). ${ }^{13}$ C NMR ( $101 \mathrm{MHz}, \mathrm{CDCl} 3$ ) $\delta 145.96,143.47,141.85,106.89,82.71$, 56.60. 6,7-dimethyl-1,4-dihydro-1,4-epoxynaphthalene (3.13d)

White solid, $243 \mathrm{mg}, 79 \%$ yield; Analytical data: ${ }^{1} \mathrm{H}$ NMR (400 MHz, $\mathrm{CDCl}_{3}$ ) $\delta 7.06$ (s, 2H), 7.00 (s, 2H), 5.66 (s, 2H), $2.20(\mathrm{~s}, 6 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR (101 MHz, $\mathrm{CDCl}_{3}$ ) $\delta 146.75,143.24,132.67,122.27,82.34$, 19.91. IR (ATR): $\tilde{v}\left(\mathrm{~cm}^{-1}\right)=3081,3014,1572,1430,1348,1315,1279,1229,1195,1159,1082,993$, 892, 868, 846, 815, 753, 698, 645, 578; HRMS (APPI/LTQ-Orbitrap) calcd for $\mathrm{C}_{12} \mathrm{H}_{13} \mathrm{O}^{+}[\mathrm{M}+\mathrm{H}]^{+}$: 173.0961, Found: 173.0963.

## 6,7-dibromo-1,4-dihydro-1,4-epoxynaphthalene (3.13e)

White solid, $1.01 \mathrm{~g}, 66 \%$ yield; Analytical data: ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.48$ (s, 2H), 7.00 (s, 2 H ), 5.67 (s, 2H). ${ }^{13} \mathrm{C}$ NMR ( $101 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 150.34,142.82,125.61,120.79,81.93$. IR (ATR): $\tilde{v}$ $\left(\mathrm{cm}^{-1}\right)=3081,3014,1572,1431,1279,1082,994,868,846,698,645,578$; HRMS (APPI/LTQOrbitrap) calcd for $\mathrm{C}_{10} \mathrm{H}_{6} \mathrm{OBr}_{2}{ }^{+}[\mathrm{M}]^{+}$: 299.8780, Found: 299.8779.

White solid, $703 \mathrm{mg}, 86 \%$ yield; Analytical data: ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 4.77$ (s, 4H), 3.81 (s, 6 H ). ${ }^{13} \mathrm{C}$ NMR ( $101 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 155.22,81.01,55.45,55.31$. IR (ATR): $\tilde{\mathrm{v}}\left(\mathrm{cm}^{-1}\right)=3009$, 2961, 1751, 1445, 1376, 1252, 1156, 949, 902, 790; HRMS (ESI/QTOF) calcd for $\mathrm{C}_{8} \mathrm{H}_{10} \mathrm{O}_{6} \mathrm{Na}^{+}[\mathrm{M}+\mathrm{Na}]^{+}$: 225.0370, Found: 225.0369.

Colorless oil, $1.09 \mathrm{~g}, 95 \%$ yield; Analytical data: ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) 4.70 (s, 4H), 1.49 (s, $18 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $101 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 152.85,83.17,81.03,54.59,27.84$. IR (ATR): $\tilde{v}\left(\mathrm{~cm}^{-1}\right)=2981$, $2938,1745,1479,1457,1436,1370,1271,1251,1148,1086,931,856,791$; HRMS (APCI/QTOF) calcd for $\mathrm{C}_{14} \mathrm{H}_{22} \mathrm{O}_{6} \mathrm{Na}^{+}[\mathrm{M}+\mathrm{Na}]^{+}: 309.1309$, Found: 309.1300.

White solid, $0.69 \mathrm{~g}, 48 \%$ yield; Analytical data: ${ }^{1} \mathrm{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.38$ (ddd, $J=3.5,2.4$, $1.3 \mathrm{~Hz}, 7 \mathrm{H}$ ), $7.36-7.33(\mathrm{~m}, 3 \mathrm{H}), 5.19(\mathrm{~s}, 4 \mathrm{H}), 4.78(\mathrm{~s}, 4 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $101 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 154.60$, 134.97, 128.79, 128.75, 128.50, 81.09, 70.25, 55.54. IR (ATR): $\tilde{v}\left(\mathrm{~cm}^{-1}\right)=3066,3034,2956,1748$, 1455, 1390, 1366, 1233, 1157, 938, 787, 754, 697; HRMS (ESI/QTOF) calcd for $\mathrm{C}_{20} \mathrm{H}_{18} \mathrm{O}_{6} \mathrm{Na}^{+}$ $[\mathrm{M}+\mathrm{Na}]^{+}: 377.0996$, Found: 377.0993.

White solid, $593 \mathrm{mg}, 83 \%$ yield; Analytical data: ${ }^{1} \mathrm{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.38$ (d, $J=8.0 \mathrm{~Hz}$, $4 \mathrm{H}), 7.31$ (dd, $J=8.6,7.2 \mathrm{~Hz}, 4 \mathrm{H}$ ), $7.09(\mathrm{tt}, J=7.1,1.3 \mathrm{~Hz}, 2 \mathrm{H}), 6.66(\mathrm{~s}, 2 \mathrm{H}), 4.84(\mathrm{~s}, 4 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR
( $101 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 152.63,137.53,129.25,123.96,118.90,81.25,53.01$. IR (ATR): $\tilde{\mathrm{v}}\left(\mathrm{cm}^{-1}\right) 3331$, 3053, 1702, 1604, 1542, 1502, 1447, 1316, 1301, 1233, 1060, 742, 691; HRMS (ESI/QTOF) calcd for $\mathrm{C}_{18} \mathrm{H}_{16} \mathrm{~N}_{2} \mathrm{O}_{4} \mathrm{Na}^{+}[\mathrm{M}+\mathrm{Na}]^{+}: 347.1002$, Found: 347.1005.

White solid, $763 \mathrm{mg}, 89 \%$ yield; Analytical data: ${ }^{1} \mathrm{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 8.08(\mathrm{~d}, \mathrm{~J}=7.4 \mathrm{~Hz}$, $4 \mathrm{H}), 7.58(\mathrm{t}, J=7.5 \mathrm{~Hz}, 2 \mathrm{H}), 7.45(\mathrm{t}, J=7.5 \mathrm{~Hz}, 4 \mathrm{H}), 5.00(\mathrm{~s}, 4 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $101 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta$ 165.93, 133.45, 129.94, 129.51, 128.55, 81.11, 52.75. IR (ATR): $\tilde{v}\left(\mathrm{~cm}^{-1}\right)=3064,2944,1721,1601$, 1452, 1371, 1315, 1260, 1177, 1156, 1093, 1069, 1026, 956, 708, 687; HRMS (ESI/QTOF) calcd for $\mathrm{C}_{18} \mathrm{H}_{14} \mathrm{O}_{4} \mathrm{Na}^{+}[\mathrm{M}+\mathrm{Na}]^{+}: 317.0784$, Found: 317.0784.

but-2-yne-1,4-diyl diacetate (3.14h)
Colorless oil, $470 \mathrm{mg}, 91 \%$ yield; Analytical data: ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 4.71$ (s, 4H), 2.10 (s, 6 H ). ${ }^{13} \mathrm{C}$ NMR ( $101 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 170.09,80.84,52.10,20.68$. IR (ATR): $\tilde{\mathrm{v}}\left(\mathrm{cm}^{-1}\right)=2947,1742$, 1434, 1378, 1361, 1215, 1155, 1025, 966, 917, 831; HRMS (EXI/QTOF) calcd for $\mathrm{C}_{8} \mathrm{H}_{10} \mathrm{O}_{4} \mathrm{Na}^{+}$ [M+Na] ${ }^{+}$: 193.0471, Found: 193.0472.

2,2,3,3,10,10,11,11-octamethyl-4,9-dioxa-3,10-disiladodec-6-yne (3.14i)
Colorless oil, $522 \mathrm{mg}, 95 \%$ yield; Analytical data: ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 4.34$ (s, 4H), 0.91 (s, 18H), 0.12 (s, 12H). ${ }^{13} \mathrm{C}$ NMR ( $101 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 83.49,51.95,25.98,18.45,-5.00$. IR (ATR): $\tilde{v}$ $\left(\mathrm{cm}^{-1}\right)=2955,2930,2887,2858,1472,1463,1363,1254,1135,1095,1069,1005,833,815,776 ;$ HRMS (APPI/LTQ-Orbitrap) calcd for $\mathrm{C}_{10} \mathrm{H}_{34} \mathrm{O}_{2} \mathrm{Si}_{2}{ }^{+}[\mathrm{M}]^{+}: 314.2092$, Found: 314.2092.

1,4-bis(benzyloxy)but-2-yne (3.14j)
Colorless oil, 600 mg , $84 \%$ yield; Analytical data: ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) 7.40 - 7.27 (m, 10H), 4.62 (s, 4H), 4.25 (s, 4H). ${ }^{13} \mathrm{C} \operatorname{NMR}\left(101 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 137.49,128.57,128.18,128.00,82.64$, $71.75,57.56$. IR (ATR): $\tilde{v}\left(\mathrm{~cm}^{-1}\right)=3029,2942,2854,1496,1454,1386,1348,1260,1207,1138$, 1118, 1068, 1027, 939, 905, 736, 696, 605; HRMS (APPI/LTQ-Orbitrap) calcd for $\mathrm{C}_{18} \mathrm{H}_{18} \mathrm{O}_{2}{ }^{+}[\mathrm{M}]^{+}$: 266.1301, Found: 266.1302.

## Preparation of S,S'-(but-2-yne-1,4-diyl) diethanethioate (3.14k)

1,4-Dibromobut-2-yne ( $0.223 \mathrm{ml}, 2.12 \mathrm{mmol}$ ) was added to 3 mL of DMF and cooled to $0{ }^{\circ} \mathrm{C}$. Potassium thioacetate ( $0.534 \mathrm{~g}, 4.67 \mathrm{mmol}$ ) in 3 ml of DMF was added within 30 min . The ice bath was subsequently removed and the reaction mixture was stirred for 1 h at room temperature. The reaction mixture was added to 60 mL of 1 N HCl . Next, the aqueous layer was extracted with $\mathrm{Et}_{2} \mathrm{O}$ ( $2 \times 15 \mathrm{ml}$ ). The combined organic layers were washed with $1 \mathrm{~N} \mathrm{HCl}(\mathrm{aq})(2 \times 25 \mathrm{ml})$ and dried over $\mathrm{MgSO}_{4}$. After the solvent was removed under reduced pressure, the residue was purified by silica gel column chromatography ( $n$-pentane/ethyl acetate $=10 / 1$ ) to afford the product $\mathbf{2 i}$ ( $515 \mathrm{mg}, 91 \%$ yield).

Pale yellow solid, $515 \mathrm{mg}, 91 \%$ yield; $\mathrm{Mp}=42-43{ }^{\circ} \mathrm{C}$; Analytical data: ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta$ 3.64 (s, 4H), 2.35 ( $\mathrm{s}, 6 \mathrm{H}$ ). ${ }^{13} \mathrm{C}$ NMR ( $101 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta$ 194.06, 77.54, 30.26, 18.08. IR (ATR): $\tilde{v}$ $\left(\mathrm{cm}^{-1}\right)=2962.09,2918.61,1688.04,1398.93,1353.16,1241.64,1128.33,1101.60,1003.66$, 954.14, 708.66, 619.32, 528.56; HRMS (APPI/LTQ-Orbitrap) calcd for $\mathrm{C}_{8} \mathrm{H}_{10} \mathrm{O}_{2} \mathrm{~S}_{2} \mathrm{Na}^{+}[\mathrm{M}+\mathrm{Na}]^{+}$: 225.0014, Found: 225.0017.

Colorless oil, 244 mg , $54 \%$ yield; Analytical data: ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 4.72$ (t, J=2.2 Hz, 2H), 3.81 (s, 3H), 2.22 (tt, $J=7.1,2.2 \mathrm{~Hz}, 2 \mathrm{H}), 1.59-1.45$ (m, 2H), $1.45-1.31$ (m, 2H), 0.90 (t, $J=$ $7.2 \mathrm{~Hz}, 3 \mathrm{H}$ ). ${ }^{13} \mathrm{C}$ NMR ( $101 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) 155.46, 88.67, 73.44, 56.42, 55.13, 30.51, 22.03, 18.56, 13.69. IR (ATR): $\tilde{v}\left(\mathrm{~cm}^{-1}\right)=2958,2935,2873,2235,1750,1444,1375,1251,1150,945,901,791 ;$ HRMS (APPI/LTQ-Orbitrap) calcd for $\mathrm{C}_{10} \mathrm{H}_{6} \mathrm{OBr}_{2}{ }^{+}[\mathrm{M}+\mathrm{H}]^{+}$: 171.1016, Found: 171.1009.

## but-2-yne-1,4-diyl dimethyl bis(carbonate) (3.14n)

Colorless oil, $3.03 \mathrm{~g}, 87 \%$ yield; Analytical data: ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.33-7.26$ (m, 2H), $7.23-7.15(\mathrm{~m}, 3 \mathrm{H}), 4.27(\mathrm{t}, \mathrm{J}=2.1 \mathrm{~Hz}, 2 \mathrm{H}), 2.76-2.68(\mathrm{~m}, 2 \mathrm{H}), 2.24(\mathrm{tt}, J=7.0,2.2 \mathrm{~Hz}, 2 \mathrm{H}), 1.84$ ( $p, J=7.2 \mathrm{~Hz}, 2 \mathrm{H}$ ), $1.50(\mathrm{~s}, 1 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $101 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 141.62,128.62,128.46,126.02$, 86.16, 78.97, 51.49, 34.91, 30.21, 18.30. IR (ATR): $\tilde{v}\left(\mathrm{~cm}^{-1}\right)=3330,3026,2936,2861,2289,2224$, 1603, 1496, 1454, 1430, 1133, 1009, 745, 699; HRMS (APPI/LTQ-Orbitrap) calcd for $\mathrm{C}_{12} \mathrm{H}_{14} \mathrm{O}^{+}[\mathrm{M}]^{+}$: 174.1039, Found: 174.1037.

Colorless oil, $293 \mathrm{mg}, 68 \%$ yield; Analytical data: ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $4.78(\mathrm{t}, \mathrm{J}=1.8 \mathrm{~Hz}, 1 \mathrm{H})$, $4.31(\mathrm{t}, \mathrm{J}=1.8 \mathrm{~Hz}, 1 \mathrm{H}), 3.82(\mathrm{~s}, 1 \mathrm{H}), 1.65(\mathrm{~s}, 1 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $101 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 155.40,85.98$, 79.16, 55.75, 55.32, 51.01. IR (ATR): $\tilde{v}\left(\mathrm{~cm}^{-1}\right)=3405,2960,2863,1746,1445,1376,1253,1138$, 1017, 942, 902, 789; HRMS (APPI/LTQ-Orbitrap) calcd for $\mathrm{C}_{6} \mathrm{H}_{8} \mathrm{O}_{4}{ }^{+}[\mathrm{M}]^{+}$: 144.0417, Found: 144.0414.

## General Procedures for the Ruthenium(II)-Catalyzed Enantioselective Synthesis of Benzonorcaradiene by Coupling of Oxa-benzonorbornadienes and Internal Alkynes

3.15az

Ru.4ba ( $5.00 \mathrm{~mol} \%, 5.20 \mathrm{umol}, 3.26 \mathrm{mg}$ ) and tetrabutylammonium iodide ( $6.00 \mathrm{~mol} \%, 6.24 \mathrm{umol}$, 2.30 mg ) were dissolved in freshly distilled 2-butanone ( 0.45 ml ) in a microwave tube under an $\mathrm{N}_{2}$ atmosphere. A solution of an oxa-benzonorbornadiene 3.13 a ( $0.104 \mathrm{mmol}, 15.0 \mathrm{mg}, 1.00$ equiv.) and an alkyne $3.14 z$ ( $0.104 \mathrm{mmol}, 1.00$ equiv.) in 2-butanone ( 0.38 ml ) was added in one portion. The reaction mixture was heated to $100^{\circ} \mathrm{C}$ and stirred at that temperature. After completion of the reaction (TLC control), the reaction mixture was cooled to room temperature. The solvent was removed under reduced pressure. The reaction mixture was purified by silica gel column chromatography ( $n$-pentane/ethyl acetate) to afford the desired benzonorcaradiene 3.15az.

For the compounds (3.15bc and 3.15cc), phosphate buffered silica ( $\mathrm{pH}=7$ ) was used because of instability of the compounds on silica gel.

2-((1S,1aR,7bR)-1-(((methoxycarbonyl)oxy)methyl)-1a,7b-dihydro-1H-cyclopropa[a]naphthalen-1-yl)-2-oxoethyl methyl carbonate (3.15ac)

Off-white solid, $25.5 \mathrm{mg}, 76 \%$ yield, $95: 5$ er. $[\alpha]_{D^{20}}-94.7\left(c=1.0, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right)$; $\mathrm{Mp}=96-97^{\circ} \mathrm{C}$; Analytical data: ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.39$ (dd, $J$ $=6.9,1.9 \mathrm{~Hz}, 1 \mathrm{H}), 7.32-7.23(\mathrm{~m}, 2 \mathrm{H}), 7.20(\mathrm{~m}, 1 \mathrm{H}), 6.68(\mathrm{~d}, J=9.6 \mathrm{~Hz}, 1 \mathrm{H}), 6.19$ (dd, J = 9.5, 5.2 $\mathrm{Hz}, 1 \mathrm{H}), 5.15(\mathrm{~s}, 2 \mathrm{H}), 4.05(\mathrm{~d}, J=13.2 \mathrm{~Hz}, 1 \mathrm{H}), 3.85(\mathrm{~s}, 3 \mathrm{H}), 3.82(\mathrm{~d}, J=13.2 \mathrm{~Hz}, 1 \mathrm{H}), 3.65(\mathrm{~s}, 3 \mathrm{H})$, $3.42(\mathrm{~d}, J=8.7 \mathrm{~Hz}, 1 \mathrm{H}), 3.02(\mathrm{dd}, J=8.7,5.2 \mathrm{~Hz}, 1 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $101 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 203.07,155.55$, $155.21,132.43,130.30,130.11,129.32,128.42,128.26,127.98,122.63,70.02,61.63,55.45,54.99$, 38.52, 36.05, 24.26. The enantiomeric excess was determined by Daicel Chiralpak IF (25 cm), Hexane/IPA $=80 / 20,1.0 \mathrm{~mL} / \mathrm{min}, \lambda=254 \mathrm{~nm}, \mathrm{t}_{\mathrm{R}}($ major $)=11.1 \mathrm{~min}, \mathrm{t}_{\mathrm{R}}($ minor $)=9.8 \mathrm{~min}$.

Alternative Conditions for 2-hydroxy-1-((1S,1aR,7bR)-1-(hydroxymethyl)-1a,7b-dihydro-1H-cyclopropa[a]naphthalen-1-yl)ethan-1-one (3.15aa)

Ru.4ba ( $5 \mathrm{~mol} \%, 1.39 \mu \mathrm{~mol}, 0.869 \mathrm{mg}$ ) and triphenylphosphine ( $10 \mathrm{~mol} \%, 2.77 \mu \mathrm{~mol}, 0.728 \mathrm{mg}$ ) were dissolved in freshly distilled 2-butanone ( 0.10 ml ) in a microwave reaction vial under $\mathrm{N}_{2}$ atmosphere. lodomethane ( $35 \mathrm{~mol} \% .9 .71 \mu \mathrm{~mol}, 1.39 \mathrm{mg}$ ) was added followed by addition of a solution of an oxa-benzonorbornadiene 3.13a (1.00 equiv., $27.7 \mu \mathrm{~mol}, 4 \mathrm{mg}$ ), but-2-yne-1,4-diol $3.14 a(1.00$ equiv., $27.7 \mu \mathrm{~mol}, 2.39 \mathrm{mg}$ ) and 2-methylpyridine ( $40 \mathrm{~mol} \%, 11.1 \mu \mathrm{~mol}, 1.03 \mathrm{mg}$ ) in 2butanone ( 0.12 ml ). The reaction mixture was heated to $80^{\circ} \mathrm{C}$ for 90 min . After completion of the reaction (TLC control), the reaction mixture was cooled to room temperature. The solvent was removed under reduced pressure. The reaction mixture was purified by silica gel column chromatography ( $n$-pentane/ethyl acetate) to afford benzonorcaradiene 3.15aa.

2-hydroxy-1-((1S, 1aR,7bR)-1-(hydroxymethyl)-1a,7b-dihydro-1H-cyclopropa[a]naphthalen-1-yl)ethan-1-one (3.15aa)

## Preparation of endo-benzonorcaradiene (3.21ac)

$\left[\mathrm{CpRu}\left(\mathrm{CH}_{3} \mathrm{CN}\right)_{3}\right] \mathrm{PF}_{6}(5.00 \mathrm{~mol} \%, 10.4 \mu \mathrm{~mol}, 4.52 \mathrm{mg})$ and tetrabutylammonium iodide ( $6 \mathrm{~mol} \%$, 12.4 umol, 4.60 mg ) were dissolved in freshly distilled 2-butanone ( 0.55 ml ) in a microwave reaction vial under $\mathrm{N}_{2}$ atmosphere. The solution of an oxa-benzonorbornadiene ( $0.208 \mathrm{mmol}, 30 \mathrm{mg}, 1.0$ equiv.) and but-2-yne-1,4-diyl dimethyl dicarbonate ( $0.208 \mathrm{mmol}, 42.1 \mathrm{mg}, 1.0$ equiv.) in 2-butanone ( 1.1 ml ) was added into the microwave reaction vial. The reaction mixture was stirred at $40^{\circ} \mathrm{C}$ for 45 min . The reaction mixture was cooled to room temperature. The solvent was removed under reduced pressure. The reaction mixture was purified by column chromatography with phosphate bufferred silica gel $(\mathrm{pH}=7)\left(n\right.$-pentane/ethyl acetate $\left.=5 / 1\left(\mathrm{v} / \mathrm{v}^{\prime}\right)\right)$ to afford the endo-product (rac-3.21ac) (39 $\mathrm{mg}, 54 \%$ yield).

Ru.4ba ( $5 \mathrm{~mol} \%, 10.4$ umol, 6.52 mg ) and tetrabutylammonium iodide ( $6 \mathrm{~mol} \%, 12.0 \mathrm{umol}, 4.60$ mg ) were dissolved with freshly distilled 2-butanone ( 0.55 ml ) in a microwave reaction vial under $\mathrm{N}_{2}$ atmosphere. The solution of an oxa-benzonorbornadiene ( $208 \mathrm{umol}, 30.0 \mathrm{mg}, 1.0$ equiv.) and but-2-yne-1,4-diyl dimethyl dicarbonate ( $208 \mu \mathrm{~mol}, 42.1 \mathrm{mg}, 1.00$ equiv.) in 2-butanone ( 1.10 ml ) was added in one portion. The reaction mixture was stirred at $40^{\circ} \mathrm{C}$ for 25 min , then to room temperature. The solvent was removed under reduced pressure. The reaction mixture was purified by column chromatography on phosphate bufferred silica gel (pH=7) ( $n$-pentane/ethyl acetate $=5 / 1\left(\mathrm{v} / \mathrm{v}^{\prime}\right)$ ) to afford the endo-product (3.21ac) ( $53 \mathrm{mg}, 74 \%$ yield).

rac-2-((1S,1aS,7bS)-1-(((methoxycarbonyl)oxy)methyl)-1a,7b-dihydro-1H-cyclopropa[a]naphthalen-1-yl)-2-oxoethyl methyl carbonate (3.21ac)

Colorless oil, $39 \mathrm{mg}, 54 \%$ yield; Analytical data: ${ }^{1} \mathrm{H}$ NMR $(600 \mathrm{MHz}$, $\mathrm{CD}_{2} \mathrm{Cl}_{2}$ ) $\delta 7.44-7.39(\mathrm{~m}, 1 \mathrm{H}), 7.28(\mathrm{td}, J=7.5,1.5 \mathrm{~Hz}, 1 \mathrm{H}), 7.24(\mathrm{td}, J=$ $7.5,1.4 \mathrm{~Hz}, 1 \mathrm{H}), 7.11$ (dd, $J=7.5,1.4 \mathrm{~Hz}, 1 \mathrm{H}), 6.48(\mathrm{~d}, J=9.6 \mathrm{~Hz}, 1 \mathrm{H}), 6.11$ (dd, $J=9.7,5.1 \mathrm{~Hz}$, $1 \mathrm{H}), 4.56(\mathrm{~d}, J=17.2 \mathrm{~Hz}, 1 \mathrm{H}), 4.48(\mathrm{~d}, J=11.9 \mathrm{~Hz}, 1 \mathrm{H}), 4.32(\mathrm{~d}, J=12.0 \mathrm{~Hz}, 1 \mathrm{H}), 4.29(\mathrm{~d}, J=17.2$ $\mathrm{Hz}, 1 \mathrm{H}), 3.79$ (s, 3H), $3.69(\mathrm{~s}, 3 \mathrm{H}), 2.97(\mathrm{~d}, J=8.3 \mathrm{~Hz}, 1 \mathrm{H}), 2.55(\mathrm{dd}, J=8.3,5.1 \mathrm{~Hz}, 1 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $151 \mathrm{MHz}, \mathrm{CD}_{2} \mathrm{Cl}_{2}$ ) $\delta 196.75,155.65,155.08,131.50,129.98,129.46,128.35,128.06,127.81$, 127.43, 122.15, 72.60, 69.66, 55.41, 55.36, 31.41, 29.09, 28.84.; IR (ATR): $\tilde{v}\left(\mathrm{~cm}^{-1}\right)=3020,2958$, 1746, 1442, 1375, 1252, 1167, 1118, 1064, 951, 780, 741; HRMS (ESI) calcd for $\mathrm{C}_{18} \mathrm{H}_{18} \mathrm{O}_{7} \mathrm{Na}^{+}$ $[\mathrm{M}+\mathrm{Na}]^{+}: 369.0945$, Found: 369.0942.

All NMR data for the endo product (3.21ac) were acquired at $0^{\circ} \mathrm{C}$ because the endo product is slowly converted to exo product at room temperature.

Thermal isomerization from endo-benzonorcaradiene (3.21ac) to exo-benzonorcaradiene (3.15ac)

endo-benzonorcaradiene ( $\mathbf{3 . 2 1 a c}$ ) ( $0.051 \mathrm{mmol}, 17.7 \mathrm{mg}$ ) was dissolved in freshly distilled 2butanone ( 0.56 ml ) in a microwave reaction vial under $\mathrm{N}_{2}$ atmosphere. The reaction mixture was stirred at $100^{\circ} \mathrm{C}$ for 30 min . The reaction mixture was cooled to room temperature. The solvent was removed under reduced pressure. The reaction mixture was purified by column chromatography with silica gel ( $n$-pentane/ethyl acetate $=5 / 1\left(\mathrm{v} / \mathrm{v}^{\prime}\right)$ ) to afford the exo-benzonorcaradiene (3.15ac) (17.0 $\mathrm{mg}, 96 \%$ yield).

1D NOE experiments on exo-benzonorcaradiene (3.15ac) and endo-benzonorcaradiene (3.21ac)

1D NOE experiments were performed with exo-benzonorcaradiene (3.15ac) and endobenzonorcaradiene (3.21ac). Both samples were measured at $0^{\circ} \mathrm{C}$. Deuterated dichloromethane $\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}\right)$ and deuterated chloroform $\left(\mathrm{CDCl}_{3}\right)$ were used for endo-benzonorcaradiene and exobenzonorcaradiene, respectively.

## 1D NOE results of the endo product (3.21ac)

## 1D NOE results of the exo product (3.15ac)

## X-ray Structure of 3.15aa.

Crystallographic data: CCDC 1947117 contains the supplementary crystallographic data for this paper. These data can be obtained free of charge from The Cambridge Crystallographic Data Centre via www.ccdc.cam.ac.uk/data_request/cif.

## Computational Details

GAMESS ${ }^{107}$ was used for the quantum chemical calculation. The geometries of all species were optimized with B3LYP ${ }^{103} / 6-31 G(d, p)^{104}$. The same method and basis sets are used for computing Gibbs free energy considering thermal and zero-point energy contribution, and scale factor for vibrational frequencies are adapted. ${ }^{105}$ All of transition states have only one imaginary vibrational mode and none of minima has an imaginary vibrational mode.

### 8.4 Enantioselective Ruthenium(II)-Catalyzed Alkylative Cycloetherification

## Preparation of hexa-4,5-dien-1-ol (4.18)

Hexa-4,5-dien-1-ol was prepared according to the published procedures. ${ }^{135}$

pale yellow oil, $2.10 \mathrm{~g}, 37 \%$ yield; Analytical data: ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 5.13(\mathrm{p}, \mathrm{J}=6.7 \mathrm{~Hz}$, $1 \mathrm{H}), 4.69$ (dt, J = 6.6, $3.3 \mathrm{~Hz}, 2 \mathrm{H}$ ), 3.70 ( $\mathrm{q}, \mathrm{J}=6.0 \mathrm{~Hz}, 2 \mathrm{H}$ ), 1.27 (br, 1 H ). ${ }^{13} \mathrm{C}$ NMR ( $101 \mathrm{MHz}, \mathrm{CDCl} 3$ ) $\delta 208.61,89.54,75.24,62.37,31.96,24.57$. IR (ATR): $\tilde{v}\left(\mathrm{~cm}^{-1}\right)=3339,2939,2867,1956,1704$, 1438, 1058, 844.

General Procedures for the Ruthenium(II)-Catalyzed Enantioselective Alkylative Cycloetherification

Ru.2ba ( $10.0 \mathrm{~mol} \%, 1.28 \mathrm{umol}, 0.976 \mathrm{mg}$ ), hexa-4,5-dien-1-ol ( $0.013 \mathrm{mmol}, 1.31 \mathrm{mg}, 1$ equiv.), phenyl vinyl ketone ( $0.019 \mathrm{mmol}, 2.54 \mathrm{mg}, 1.5$ equiv.) and additive were dissolved in freshly distilled DMF ( $51 \mu \mathrm{l}, 0.25 \mathrm{M}$ ) under an $\mathrm{N}_{2}$ atmosphere. The reaction vessel was covered by aluminum foil, and the reaction mixture was stirred for 3 h at $60^{\circ} \mathrm{C}$. Then, the reaction mixture was cooled to room
temperature. The reaction mixture was filtered through short silica pad. The reaction mixture was purified by silica gel column chromatography ( $n$-pentane/ethyl acetate $=4 / 1(\mathrm{v} / \mathrm{v}$ ')) to afford the desired cyclic ether 4.20.

1-phenyl-4-(tetrahydrofuran-2-yl)pent-4-en-1-one (4.20)
Colorless oil, Analytical data: ${ }^{1} \mathrm{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 8.02-7.93(\mathrm{~m}, 2 \mathrm{H}), 7.61-7.52(\mathrm{~m}, 1 \mathrm{H})$, $7.51-7.42(\mathrm{~m}, 2 \mathrm{H}), 5.13-5.07(\mathrm{~m}, 1 \mathrm{H}), 4.87-4.82(\mathrm{~m}, 1 \mathrm{H}), 4.35(\mathrm{t}, \mathrm{J}=7.3 \mathrm{~Hz}, 1 \mathrm{H}), 3.94(\mathrm{dt}, \mathrm{J}=$ 8.2, 6.7 Hz, 1H), 3.82 (td, J=7.8, 6.3 Hz, 1H), 3.29-3.11 (m, 2H), 2.61-2.37 (m, 2H), 2.18-2.02 (m, 1H), $1.99-1.87$ (m, 2H), $1.79-1.66$ (m, 1H). ${ }^{13}$ C NMR ( $101 \mathrm{MHz}, \mathrm{CDCl} 3$ ) ס 199.85, 149.25, 137.08, 133.17, 128.75, 128.20, 109.25, 81.98, 68.57, 37.44, 31.37, 26.19, 26.02. ### 8.5 Enantioselective Ru(II)-catalyzed [2+1] Cycloaddition of Ruthenium Vinyl Carbene

## Preparation of Substrates

The following compounds were prepared according to the published procedures.
$N$-cinnamyl-4-methyl- $N$-(prop-2-yn-1-yl)benzenesulfonamide (5.18), ${ }^{136} \quad 4$-methyl- $N$-(2-methyl-1-oxopropan-2-yl)- $N$-(prop-2-yn-1-yl)benzenesulfonamide (5.24). ${ }^{121}$

White solid, $357 \mathrm{mg}, 75 \%$ yield; Analytical data: ${ }^{1} \mathbf{H} \operatorname{NMR}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.77(\mathrm{~d}, \mathrm{~J}=8.4 \mathrm{~Hz}$, 2 H ), $7.41-7.18(\mathrm{~m}, 7 \mathrm{H}), 6.57$ (dt, J = 15.8, $1.4 \mathrm{~Hz}, 1 \mathrm{H}$ ), 6.08 (dt, J = 15.8, 6.9 Hz, 1H), $4.13(\mathrm{~d}, \mathrm{~J}=$ $2.5 \mathrm{~Hz}, 2 \mathrm{H}$ ), $4.00(\mathrm{dd}, \mathrm{J}=6.9,1.3 \mathrm{~Hz}, 2 \mathrm{H}), 2.44(\mathrm{~s}, 3 \mathrm{H}), 2.05(\mathrm{t}, \mathrm{J}=2.4 \mathrm{~Hz}, 1 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( 101 MHz , CDCl3) ס 143.74, 136.22, 136.17, 135.04, 129.65, 128.74, 128.20, 127.92, 126.67, 123.02, 76.73, 73.96, 48.71, 36.02, 21.70. IR (ATR): $\tilde{v}\left(\mathrm{~cm}^{-1}\right)=3288,3027,2921,2858,1597,1495,1447,1345$, 1158, 1094, 968, 897, 814, 754, 735, 692, 658, 568, 542.

4-methyl- $N$-(2-methyl-1-oxopropan-2-yl)- $N$-(prop-2-yn-1-yl)benzenesulfonamide (5.24)
White solid, $1.34 \mathrm{~g}, 70 \%$ yield; Analytical data: ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 9.65$ (s, 1H), 7.81 (d, J $=8.4 \mathrm{~Hz}, 2 \mathrm{H}), 7.37-7.28(\mathrm{~m}, 2 \mathrm{H}), 4.11(\mathrm{~d}, \mathrm{~J}=2.5 \mathrm{~Hz}, 2 \mathrm{H}), 2.44(\mathrm{~s}, 3 \mathrm{H}), 2.19(\mathrm{t}, \mathrm{J}=2.5 \mathrm{~Hz}, 1 \mathrm{H})$, 1.49 (s, 6H). ${ }^{13} \mathrm{C}$ NMR ( $101 \mathrm{MHz}, \mathrm{CDCl} 3$ ) $\delta 198.42,144.28,136.90,129.79,128.26,79.40,73.55$, 67.34, 34.53, 21.91, 21.70. IR (ATR): $\tilde{v}\left(\mathrm{~cm}^{-1}\right)=3279,2988,2817,1736,1597,1327,1305,1167$, 1150, 1083, 1050, 881, 814, 730, 663, 583, 544.

## General Procedure for the Ruthenium(II)-Catalyzed Enantioselective Ru(II)-catalyzed [2+1] Cycloaddition of Ruthenium Vinyl Carbene for Bicycle[3.1.0]hexanes (5.20)

$N$-cinnamyl-4-methyl- $N$-(prop-2-yn-1-yl)benzenesulfonamide 5.18 ( $0.024 \mathrm{mmol}, 7.75 \mathrm{mg}, 1.0$ equiv.), Ru.2ba ( $5.00 \mathrm{~mol} \%, 1.19 \mathrm{umol}, 0.907 \mathrm{mg}$ ) and tetrabutylammonium chloride ( $6.00 \mathrm{~mol} \%$, 1.43 umol, 0.397 mg ) were dissolved in toluene ( $80.0 \mu \mathrm{l}, 0.3 \mathrm{M}$ ) in a test tube under $\mathrm{N}_{2}$ atmosphere. A solution of TMS-diazomethane in ether ( $2 \mathrm{M}, 0.026 \mathrm{mmol}, 13.1 \mu \mathrm{l}, 1.1$ equiv.) was added to the reaction mixture. The reaction mixture was stirred at room temperature for 18 h . The reaction mixture was filtered through silica pad. The filtrate was concentrated under reduced pressure. The crude product was purified by silica gel column chromatography ( $n$-pentane/ethyl acetate $=15 / 1(\mathrm{v} / \mathrm{v})$ ), which delivered the bicycle[3.1.0]hexane (5.20).

cis-6-phenyl-3-tosyl-1-((Z)-2-(trimethylsilyl) vinyl)-3-azabicyclo[3.1.0]hexane ((Z)-5.20)
Pale yellow oil, Analytical data: ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.73$ (d, J = $8.3 \mathrm{~Hz}, 2 \mathrm{H}$ ), $7.39-7.33$ (m, 2H), 7.22 (dd, J = 8.1, $6.5 \mathrm{~Hz}, 2 \mathrm{H}$ ), $7.18-7.11$ (m, 1H), 6.93 (dd, J = 8.3, 1.3 Hz, 2H), 6.00 (d, J $=15.1 \mathrm{~Hz}, 1 \mathrm{H}), 5.65(\mathrm{~d}, \mathrm{~J}=15.2 \mathrm{~Hz}, 1 \mathrm{H}), 3.80(\mathrm{~d}, \mathrm{~J}=9.4 \mathrm{~Hz}, 1 \mathrm{H}), 3.73(\mathrm{~d}, \mathrm{~J}=9.4 \mathrm{~Hz}, 1 \mathrm{H}), 3.36(\mathrm{dd}$, $J=9.4,3.9 \mathrm{~Hz}, 1 \mathrm{H}), 3.15(\mathrm{~d}, \mathrm{~J}=9.4 \mathrm{~Hz}, 1 \mathrm{H}), 2.46(\mathrm{~s}, 3 \mathrm{H}), 2.17(\mathrm{~d}, \mathrm{~J}=4.2 \mathrm{~Hz}, 1 \mathrm{H}), 1.91(\mathrm{t}, \mathrm{J}=4.0$ $\mathrm{Hz}, 1 \mathrm{H}),-0.09(\mathrm{~s}, 9 \mathrm{H})$. The enantiomeric excess of was determined by Daicel Chiralpak IB ( 25 cm ), Hexane $/ I P A=98 / 02,1.0 \mathrm{~mL} / \mathrm{min}, \lambda=254 \mathrm{~nm}, \mathrm{t}_{\mathrm{R}}($ major $)=18.7 \mathrm{~min}, \mathrm{t}_{\mathrm{R}}($ minor $)=12.6 \mathrm{~min}$

Sung Hwan Park, Shou-Guo Wang, Nicolai Cramer* "Enantioselective Ruthenium(II)-Catalyzed Access to Benzonorcaradienes by Coupling of Oxabenzonorbornadienes and Alkynes" ACS Catal. 2019, 9, 1022610231.

Shou-Guo Wang, Sung Hwan Park, Nicolai Cramer* "A Readily Accessible Class of Chiral Cp Ligands and their Application in Rull-Catalyzed Enantioselective Syntheses of Dihydrobenzoindoles." Angew. Chem. Int. Ed. 2018, 57, 5459-5462.

Yiyun Chen, Sung Hwan Park, Chung Whan Lee and Chulbom Lee* "Ruthenium-Catalyzed Three-Component Coupling via Hydrative Conjugate Addition of Alkynes to Alkenes: One-Pot Synthesis of 1,4-Dicarbonyl Compounds" Chem.- Asian J. 2011, 6, 2000-2004.

## Patents

Granted Patent
Domestic Patent

Hyun Aee Chun, Sang Yong Tak, Su Jin Park, Yun Ju Kim, Sung Hwan Park, "Epoxy Compound Having Alkoxysilyl Group, Preparing Method Thereof, Composition comprising the Same and Cured Product and Use Thereof" Korea Patent 10-1252063, filed August 24, 2012, Issued April 2, 2013.

Hyun Aee Chun, Sang Yong Tak, Su Jin Park, Yun Ju Kim, Sung Hwan Park, Sook Yeon Park "Isocyanurate Epoxy Compound Having Alkoxysilyl Group, Preparing method thereof, Composition comprising the Same
and Crude Product and Use Thereof" Korea Patent 10-1456025, filed November 1, 2012. Issued October 23, 2014.

Hyun Aee Chun, Su Jin Park, Sook Yeon Park, Yun Ju Kim, Sang Yong Tak, Sung Hwan Park, Kyung Nam Kang" Composition and Cured Product Comprising Epoxy Compound Having Alkoxysilyl Group and Inorganic Particle, Use Thereof and Preparing Method of Epoxy Compound Having Alkoxysilyl Group" Korea Patent 101520764, filed February 1, 2013. , Issued May 11, 2015.

Hyun Aee Chun, Yun Ju Kim, Sang Yong Tak, Su Jin Park, Sung Hwan Park "Novolac-based Epoxy Compound, Preparing Method Thereof, Composition, Cured Product thereof, And Use Thereof" Korea Patent10-1863111, filed July 4, 2013. Issued May 25, 2018.

Hyun Aee Chun, Yun Ju Kim, Su Jin Park, Sang Yong Tak, Sung Hwan Park, Kyung Nam Kang, Sook Yeon Park "Epoxy Compound Having Alkoxysilyl Group, Preparing Method Thereof, Composition Comprising the Same and Cured Product and Use Thereof" Korea Patent 10-1596880, filed September 17, 2013, Issued February 17, 2016.

Hyun Aee Chun, Sung Hwan Park, Yun Ju Kim, Su Jin Park, Sook Yeon Park, Sang Yong Tak "Epoxy Compound Having Alkoxysilyl Group, Preparing Method Thereof, Composition Comprising the Same and Cured Product and Use Thereof" Korea Patent 10-1655857, filed February 25, 2014, Issued September 2, 2016.

Hyun Aee Chun, Su Jin Park, Sang Yong Tak, Yun Ju Kim, Sook Yeon Park, Sung Hwan Park "Epoxy Compound Having Alkoxysilyl Group, Composition, Cured Product Thereof, Use Thereof And Preparing Method of Epoxy Compound Having Alkoxysilyl Group" Korea Patent 10-1898526, filed April 2, 2013, Issued September 7, 2018.

Hyun Aee Chun, Sung Hwan Park, Yun Ju Kim, Su Jin Park, Sook Yeon Park, Sang Yong Tak "Alkoxysilyl Compound Having at Least Two Alkoxysilyl Groups, Composition, Cured Product Thereof, Use Thereof and Preparing Method of Alkoxysilyl Compound Having at Least Two Alkoxysilyl Groups" Korea Patent 101644531, filed June 10, 2014, Issued July 27, 2016.

Hyun Aee Chun, Yun Ju Kim, Su Jin Park, Sook Yeon Park, Sung Hwan Park, Sang Yong Tak "Epoxy Compound Having Alkoxysilyl Group, Composition, Cured Product Thereof, Use Thereof And Preparing Method Of Epoxy Compound Having Alkoxysilyl Group" Korea Patent 10-1992845, filed March 14, 2013, Issued June 19, 2019.

## International Patent

Hyun Aee Chun, Sang Yong Tak, Su Jin Park, Yun Ju Kim, Sung Hwan Park, "Epoxy Compound Having Alkoxysilyl Group, Method for Preparing Same, Composition and Cured Material Comprising Same, and Usage Thereof" PCT/KR2012/006832, filed August 27, 2012, EU 2767535, JP 5852243.

Hyun Aee Chun, Sang Yong Tak, Su Jin Park, Yun Ju Kim, Sung Hwan Park, Sook Yeon Park, "Isocyanurate Epoxy Compound Having Alkoxysilyl Group, Method of Preparing Same, Composition Including Same, Cured Product of the Composition, and Use of the Composition" PCT/KR2012/009130, filed November 1, 2012. EU 2774929, US 9534075.

Hyun Aee Chun, Yun Ju Kim, Su Jin Park, Sook Yeon Park, Sung Hwan Park, Sang Yong Tak, "Epoxy Compound Having Alkoxy Silyl Group, Composition Comprising Same, Cured Product, Use Thereof and Method for Preparing Epoxy Compound Having Alkoxy Silyl Group" PCT/KR2013/002062, filed March 14, 2013, US 9902803.

Hyun Aee Chun, Yun Ju Kim, Sang Yong Tak, Su Jin Park, Sung Hwan Park, "Novolac-based Epoxy Compound, Production Method for Same, Composition and Cured Article Comprising Same, and Use for Same" PCT/KR2013/006005, filed July 5, 2013, EU 2871182, US 9670309.

Hyun Aee Chun, Yun Ju Kim, Su Jin Park, Sang Yong Tak, Sung Hwan Park, Kyung Nam Kang, Sook Yeon Park "Epoxy Compound Having Alkoxysilyl Group, Method for Preparing Same, Composition Comprising Same, Cured Product Made Therefrom, and Use Thereof" PCT/KR2013/008439, filed September 17, 2013, EU 2933257, US 9725590, JP 6173464.

Hyun Aee Chun, Sung Hwan Park, Yun Ju Kim, Su Jin Park, Sook Yeon Park, Sang Yong Tak "Epoxy Compound Having Alkoxysilyl Group, Method for Manufacturing Same, Composition and Cured Product Including Same, and Use Thereof" PCT/KR2014/001528, filed February 25, 2014, JP 6153631.

## Pending Patent

International Patent

Hyun Aee Chun, Su Jin Park, Sook Yeon Park, Yun Ju Kim, Sang Yong Tak, Sung Hwan Park, Kyung Nam Kang, "Composition and Cured Article Comprising Inorganic Particles and Epoxy Compound Having Alkoxysilyl Group, Use for Same, and Production Method for Epoxy Compound Having Alkoxysilyl Group" PCT/KR2013/001211, filed February 15, 2013. Patent Pending.

Hyun Aee Chun, Su Jin Park, Sang Yong Tak, Yun Ju Kim, Sook Yeon Park, Sung Hwan Park" Epoxy Compound Having Alkoxysilyl Group, Composition and Hardened Material Comprising Same, Use For Same, and Production Method for Epoxy Compound Having Alkoxysilyl Group" PCT/KR2013/002730, filed April 2, 2013. Patent Pending.

## Others

2009
Certificate of the KCS-approved Bachelor's Degree in Chemistry and Related Fields, The Korean Chemical Society

Chapter 9 Appendix

### 9.2 Optimized Geometry

## Allyl vinyl ether (3.20ac)
