# Copper-Catalyzed Alkynylation of Hydrazides: An Easy Access to Functionalized Azadipeptides 

Eliott Le Du,${ }^{\ddagger}$ Julien Borrel ${ }^{\ddagger}$ and Jerome Waser*<br>Laboratory of Catalysis and Organic Synthesis, Institute of Chemical Sciences and Engineering, Ecole Polytechnique Fédérale de Lausanne, EPFL SB ISIC LCSO, BCH 4306, 1015 Lausanne, Switzerland.<br>Supporting Information Placeholder

#### Abstract

We report a copper-catalyzed alkynylation of azadipeptides using ethynylbenziodoxolone (EBX) reagents. Non-symmetrical ynehydrazides could be obtained in $25-97 \%$ yield using azaglycine derivatives as nucleophiles. The transformation is compatible with most functional groups naturally occurring on amino acid side-chains and allows the transfer of silyl-, alkyl- and arylsubstituted alkynes. The obtained $\alpha$-alkynyl azaglycine products could be further functionalized by nucleophilic attack or cycloaddition on the triple bond.

In the last decades, the alkynylation of nitrogen-based nucleophiles has been the focus of intensive research due to the synthetic versatility of the formed ynamines/ynamides products. ${ }^{1}$ Most methods relied on copper-catalysis with free or pre-activated alkynes (including halides, carboxylic acid, organometallic reagents and hypervalent iodine reagents (HIR), Scheme 1A). ${ }^{1}$ Among the potential coupling partners capable of transferring alkynes, HIR particularly attracted attention as they allowed the use of milder reaction conditions. ${ }^{2}$ While alkynylation using mononitrogen-based nucleophiles is well established, only few examples of the synthesis of ynehydrazides are reported. ${ }^{3}$ Initial attempts to alkynylate hydrazides with alkynyl HIR or bromalkynes required harsh conditions and/or afforded the products in poor yields. ${ }^{3 c, \mathrm{~d}}$ To circumvent this issue, Batey and Beveridge followed an Umpolung strategy using azodicarboxylates as hydrazide precursors and acetylides nucleophiles (Scheme 1B). ${ }^{3 \mathrm{~d}}$ The obtained products could then be used in diverse applications. ${ }^{3-\mathrm{h}}$ However, this transformation was limited to symmetrical azodicarboxylates and required a strong base. Therefore, the development of a milder protocol suitable for non-symmetrical hydrazides would be beneficial.

Among hydrazide nucleophiles, azaglycine derivatives constitute a unique class (Scheme 1C). These amino acid analogs, in which the $\alpha$-carbon is replaced by a nitrogen atom, enable the fine-tuning of the structural and conformational features of bioactive peptides. ${ }^{4}$ Notably, azapeptides exhibit enhanced protease stability, ${ }^{5}$ greater H-bonding capability, ${ }^{6}$ and usually favor $\beta$-turn. ${ }^{7}$ While N -alkylation and N -arylation of azaglycine have been reported, ${ }^{8}$ to the best of our knowledge, N -alkynylation remains unexplored. Moreover, $\alpha$-alkynyl amino acids have been shown to be irreversible enzyme inhibitors and versatile building blocks in the synthesis of bioactive compounds. ${ }^{9}$ An
easy access to their $\alpha$-alkynyl azaglycine analogues would therefore be valuable.

A. Alkynylation of nitrogen-based nucleophiles ${ }^{1,2}$

- harsh conditions - symmetrical hydrazide
C. This work: Cu-catalyzed alkynylation of azadipeptides

Our group and others have shown that HIR were ideal reagents for the selective functionalization of peptides. ${ }^{10}$ Herein, we report the successful copper-catalyzed alkynylation of azadipeptide derivatives (Scheme 1C). The mild reaction conditions allowed a broad functional group tolerance on the side chain of the peptides. Various types of alkynes could be transferred and undergo further transformations, enabling an easy access to functionalized azadipeptides.

We started our investigations using as model substrate semicarbazone 2a, a proline-azaglycine dipeptide with the N-terminus protected as an imine. ${ }^{11}$ Reaction of the later with TIPSEBX (3a) for 1 hour in the presence of $\mathrm{Cu}\left(\mathrm{CH}_{3} \mathrm{CN}\right)_{4} \mathrm{BF}_{4}$ and potassium tert-butoxide led to the formation of $\mathbf{4 a}$ in an encouraging $20 \%$ yield (Table 1, entry 1). A similar result could be obtained using $\mathrm{Cs}_{2} \mathrm{CO}_{3}$ as a milder base (entry 2 ). Increased formation of the desired product was observed when the reaction was heated to $40^{\circ} \mathrm{C}$ (entry 3). Replacing acetonitrile by $i$ - PrOH or DCE increased the yield to $48 \%$ and $60 \%$ respectively (entries 4 and 5). Several copper catalysts can promote the reaction, with the best result obtained using CuI, affording $76 \%$ of $\mathbf{4 a}$ (entries 6-8). No difference could be observed when the transformation was carried out with an excess of TIPS-EBX (3a) (entry 9). Control reactions without base or copper catalyst resulted in, respectively, no reaction or degradation of the azapeptide derivative (entries 10 and 11). Finally, DCM could be used as an alternative to DCE without impacting the reaction outcome (entry 12).

## Table 1. Optimization of the azapeptide alkynylation. ${ }^{\text {a }}$

${ }^{\text {a Reaction }}$ conditions: semicarbazone 2a (1.0 equiv.), TIPS-EBX (3a) ( 1.0 equiv.), catalyst ( $5 \mathrm{~mol} \%$ ), base ( 1.5 equiv.), solvent ( 0.1 $\mathrm{M})$, reactions were carried out under air at the indicated temperature for 1 hour on a 0.05 mmol scale. Isolated yields are reported. ${ }^{\mathrm{b}}$ TIPS-EBX (3a) ( 1.5 equiv.). ${ }^{\mathrm{c}}$ No conversion of starting materials.
${ }^{\mathrm{d}}$ Decomposition of $\mathbf{2 a}$.
With the optimized conditions in hand, we started to explore the scope of amino acids present on the urea (Scheme 2). Carrying out the reaction on scope scale ( 0.3 mmol ) using the model substrate afforded $\mathbf{4 a}$ in $76 \%$ yield. Simple glycine or alanine gave the corresponding alkynylated azapeptide derivatives $\mathbf{4 b}$ and $\mathbf{4 c}$ in good yields. Product $\mathbf{4 b}$ could be obtained in
$97 \%$ yield on a 1 mmol scale. More sterically demanding valine only afforded $38 \%$ of 4d. Aromatic residues are tolerated in the reaction and good yields can be obtained for phenylalanine (2e) and tryptophan (2f). However, lower efficiency was observed with tyrosine ( $\mathbf{2 g}$ ), probably due to the presence of an unprotected phenol. Methionine derived semicarbazone (2h) could be alkynylated in $58 \%$ yield with no side reactivity of the sulfur atom with the hypervalent iodine reagent. ${ }^{12}$ With serine, product $\mathbf{4 i}$ could be obtained in a moderate $29 \%$ yield. Amino acids bearing additional nitrogen atoms, such as protected lysine ( $\mathbf{2 j}$ ) or asparagine ( $\mathbf{2 k}$ ) were alkynylated selectively on the azaglycine affording $\mathbf{4 j}$ and $\mathbf{4 k}$ in $76 \%$ and $56 \%$ yields, respectively. Protected glutamic acid (21) was well tolerated in the reaction. Finally, using a methyl carbamate protected azaglycine, we could access $\mathbf{4 m}$ in $60 \%$ yield. Replacing the protecting group with a bulkier tert-butyl carbamate (2n) led to a drop in yield.

## Scheme 2. Scope of amino acids. ${ }^{\text {a }}$

${ }^{\text {a }}$ Reaction conditions: azapeptide derivative 2a-n (1.0 equiv.), TIPS-EBX (3a) ( 1.0 equiv.), $\mathrm{CuI}\left(5 \mathrm{~mol} \%\right.$ ), $\mathrm{Cs}_{2} \mathrm{CO}_{3}$ ( 1.5 equiv.), DCM ( 0.1 M ), $40^{\circ} \mathrm{C}, 1 \mathrm{~h}$, reactions were carried out under air on a 0.3 mmol scale. ${ }^{\mathrm{b}}$ Reaction was performed on 1 mmol scale.

Having established the compatibility of the reaction with different amino acids, we next explored the variety of alkynes that could be transferred with azapeptide derivative $\mathbf{2 b}$ as partner (Scheme 3). A variety of EBXs could be easily prepared by using established procedures or the most recent protocol developed by our group ( 1 h reaction time, no additives, no purification). ${ }^{13}$ High yields of alkynylated azapeptide derivatives could be maintained when replacing the TIPS group by a simple phe-
nyl (3b) or mesityl ( $\mathbf{3 c}$ ) substituent. The structure of $\mathbf{5 b}$ was determined by X-ray diffraction and displayed a trans-amide geometry in the solid state. Electron-withdrawing substituent on the aryl ring such as fluoride or bromide were well tolerated affording $\mathbf{5 c}$ and $\mathbf{5 d}$ with only a slight decrease in yield. ${ }^{14}$ Alkyl substituted alkynes could also be transferred. Alkynylated azapeptide derivative 5 e bearing a methyl group was obtained in $40 \%$ yield, and higher yield could be obtained with a cyclopropyl group (5f). Having a chloride on the alkyl chain was tolerated and $\mathbf{5 g}$ could be obtained in $53 \%$ yield.
Scheme 3. Scope of EBX reagents.

${ }^{\text {a }}$ Reaction conditions: azapeptide derivative $\mathbf{2 b}$ ( 1.0 equiv.), EBX 3b-h ( 1.0 equiv.), $\mathrm{CuI}\left(5 \mathrm{~mol} \%\right.$ ), $\mathrm{Cs}_{2} \mathrm{CO}_{3}$ ( 1.5 equiv.), DCM ( 0.1 M), $40^{\circ} \mathrm{C}, 1 \mathrm{~h}$. Reactions were performed on 0.3 mmol scale under air.

Finally, we explored synthetic transformations of the alkynylated azapeptide derivatives (Scheme 4). Hydration of the alkyne using PTSA afforded the corresponding amide moiety 6 bearing an $\alpha$-silyl group. To the best of our knowledge, acylation of azaglycine has not been reported so far. For instance, chloroacetyl chloride has been shown to react with the hydrazone $\mathrm{C}=\mathrm{N}$ bond. ${ }^{15} 5$-endo-dig Cyclization of the second nitrogen of the urea onto the alkyne afforded the product 7 in $63 \%$. Similar cyclic scaffolds have been shown to induce $\beta$-turn conformations in peptides. ${ }^{16}$ This type of cyclized product could only be observed as traces ( $<5 \%$ ) during the formation of alkynylated azapeptide derivatives, which proceeded at lower reaction temperature with a shorter reaction time. Attempts to deprotect the TIPS substituted product $\mathbf{4 a}$ showed that the resulting free alkyne was too unstable to be purified. To circumvent this issue, the unsubstituted alkyne was directly engaged in a copper catalyzed alkyne-azide cycloaddition affording triazole 8 in $76 \%$ yield over 2 steps. Furthermore, N-terminus deprotection using hydroxylamine afforded the free hydrazide $\mathbf{9}$ as the TFA salt in $32 \%$ isolated yield after purification by re-verse-phase HPLC.

Scheme 4. Product modification of alkynylated azadipeptide derivatives. ${ }^{\text {a }}$

${ }^{\text {a }}$ For more detailed reaction conditions see the Supporting Information.

In summary, we have developed conditions to perform the alkynylation of azadipeptide derivatives using EBX reagents and an inexpensive copper catalyst. The reaction is selective to the nitrogen of the azaglycine residue and tolerate a large variety of amino acids affording the desired alkynylated azadipeptide derivatives in moderate to good yields. The transformation is not limited to silyl protected alkynes and both aryl and alkyl acetylenes can be transferred. The products could be further functionalized using classical alkyne reactivity affording different azadipeptide derivatives. ${ }^{17}$

## 1. General information

All reactions were carried out under air unless stated otherwise. Reactions requiring heating were carried out using DrySyn heating block. For flash chromatography, distilled technical grade solvents were used. THF, toluene, $\mathrm{Et}_{2} \mathrm{O}$ and $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ were dried by passage over activated alumina under nitrogen atmosphere ( $\mathrm{H}_{2} \mathrm{O}$ content $<10 \mathrm{ppm}$, Karl-Fischer titration). Solvents were degassed by bubbling with a balloon of argon or by Freeze-Pump-Thaw when mentioned. All chemicals were purchased from Acros, Aldrich, Combi-blocks, Fluka, Fluorochem, Merck, TCI or VWR and used as such unless stated otherwise. Chromatographic purification was performed as flash chromatography using Silicycle silica 40-63 $\mu \mathrm{m}$ (230-400 mesh), using the solvents indicated as eluent with 0.1-0.5 bar pressure or using Biotage Isolera Spektra One with pre-packaged silica cartridges purchased from Buchi, models: Sepacore or GraceResolve ( $4 \mathrm{~g}, 12 \mathrm{~g}, 25 \mathrm{~g}, 40 \mathrm{~g}, 80 \mathrm{~g}, 120 \mathrm{~g}$ ). TLC was performed on Merck silica gel 60 F254 TLC glass plates and visualized with UV light and potassium permanganate, $p$-anisaldehyde or ninhydrin stain. ${ }^{1} \mathrm{H}$-NMR spectra were recorded on a Bruker DPX-400 400 MHz spectrometer in chloroform-d, DMSO- $\mathrm{d}_{6}$ or acetone $-\mathrm{d}_{6}$. All signals are reported in ppm using the residual solvent signal as internal reference (chloroform-d: 7.26 ppm , DMSO-d $6: 2.50 \mathrm{ppm}$, acetone$\mathrm{d}_{6}: 2.06 \mathrm{ppm}$ ). The data is being reported as ( $\mathrm{s}=$ singlet, $\mathrm{d}=$ doublet, $\mathrm{t}=$ triplet, $\mathrm{q}=$ quadruplet, qi = quintet, $\mathrm{m}=$ multiplet or unresolved, $\mathrm{br} \mathrm{s}=$ broad signal, coupling constant(s) in Hz , integration, assignment). ${ }^{13} \mathrm{C}$-NMR spectra were recorded with $\left\{{ }^{1} \mathrm{H}\right\}$ decoupling on a Bruker DPX-400 101 MHz spectrometer in chloroform-d, DMSO- $\mathrm{d}_{6}$ or acetone- $\mathrm{d}_{6}$. All signals are reported in ppm using the residual solvent signal as internal reference (chloroform-d: 77.0 ppm, DMSO-d $6: 39.5 \mathrm{ppm}$, acetone-d $6: 206.3$ and 29.8 ppm ). ${ }^{19} \mathrm{~F}$-NMR spectra were recorded with $\left\{{ }^{1} \mathrm{H}\right\}$ decoupling on a Bruker DPX- 400376 MHz spectrometer in chloroform-d, DMSO- $\mathrm{d}_{6}$ or acetone- $\mathrm{d}_{6}$. ${ }^{11}$ B-NMR spectra were recorded on a Bruker DPX-400 128 MHz spectrometer in DMSO- $\mathrm{d}_{6}$ or acetone- $\mathrm{d}_{6}$. High resolution mass spectrometric measurements were performed by the mass spectrometry service of ISIC at the EPFL. Electrospray-ionisation HRMS data were acquired on a Q-Tof Ultima mass spectrometer (Waters) or a Q-Tof 6530 Accurate mass spectrometer (Agilent) operated in the positive ionization mode and fitted with a standard Z-spray ion source equipped with the Lock-Spray interface. Data from the Lock-Spray were used to calculate a correction factor for the mass scale and provide accurate mass information of the analyte. Data were processed using the MassLynx 4.1 software. Atmospheric pressure photo-ionisation (APPI) HRMS measurements were done on a LTQ Orbitrap Elite instrument (Thermofisher) operated in the positive ionization mode. The raw data obtained from the Q-TOF Waters instrument does not take into account the mass of the electron for the ion, the obtained raw data has been corrected by removing (positive ionization) or adding (negative ionization) the mass of the electron ( 0.5 mDa ). Optical rotations were measured on a polarimeter using a 10 cm cell with a Na 589 nm filter. The specific solvents and concentrations (in g/100 mL) are indicated. RP-HPLC was carried out on an Agilent 1260 HPLC system with a G2260A 1260 Prep ALS Autosampler, a G1361a 1260 Prep Pump, a G1365C 1260 MWD detector and a G1364B 1260 FC-PS collector, coupled with a Waters XBridge semi-preparative C18 column ( $19 \times 150 \mathrm{~mm}, 5 \mu \mathrm{~m}$ ). Water (solvent A) and water:acetonitrile 5:95 (solvent B), each containing $0.1 \%$ TFA, were used as the mobile phase at a flow rate of $20 \mathrm{~mL}^{2} \mathrm{~min}^{-1}$. The following method was used: $100 \%$ A to $100 \%$ B in 20 minutes.

## 2. Starting materials preparation

H-Pro-OtBu, H-Gly-OtBu, H-Tyr-OtBu, H-Trp-OtBu, H-Asn-OtBu, H-Lys(Z)-OtBu•HCl, H-MetOtBu•HCl, H-Glu(OMe)-OtBu•HCl, H-Val-OtBu•HCl, H-Phe-OtBu•HCl, H-Ser-OtBu•HCl, H-AlaOtBu•HCl, phenylacetylene, 2-ethynyl-1,3,5-trimethylbenzene, ethynyltriisopropylsilane, ethynylcyclopropane, 5-chloropent-1-yne, 1-ethynyl-3-methoxybenzene, 1-ethynyl-4fluorobenzene and 2-bromo-1-(trimethylsilylethynyl)benzene were commercially available and used as received.

### 2.1 General procedures for aza-peptides synthesis

(E)-benzylidenehydrazine (9)

Following a reported procedure, ${ }^{1}$ a microwave vial was charged under $\mathrm{N}_{2}$ with hydrazine monohydrate ( $4.00 \mathrm{~mL}, 82.5 \mathrm{mmol}, 4.38$ equiv) and benzaldehyde ( $1.92 \mathrm{~mL}, 18.8 \mathrm{mmol}, 1.00$ equiv) was added dropwise at $0^{\circ} \mathrm{C}$. The reaction mixture was vigorously stirred at $100^{\circ} \mathrm{C}$ for 6 h . The reaction was cooled to rt and the product was extracted with $3 \times 2 \mathrm{~mL}$ of DCM. The combined extracts were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered and concentrated under reduced pressure. (E)-Benzylidenehydrazine (9) ( $2.19 \mathrm{~g}, 18.2 \mathrm{mmol}, 97 \%$ yield) was obtained as a yellowish oil and was used without further purification. ${ }^{2}$
${ }^{1}{ }^{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.75(\mathrm{~s}, 1 \mathrm{H}), 7.59-7.51(\mathrm{~m}, 2 \mathrm{H}), 7.38-7.27(\mathrm{~m}, 3 \mathrm{H}), 5.53$ (br s, 2). ${ }^{13} \mathrm{C}$ NMR ( $101 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 143.3,135.2,128.8,128.7,126.3$. Spectroscopic data was consistent with the values reported in the literature. ${ }^{1}$

## General procedure A for the coupling of hydrazine with amino acids

Using a slightly modified literature procedure, ${ }^{3}$ in a flame-dried round-bottom flask, at $0^{\circ} \mathrm{C}$, a solution of $N, N^{\prime}$-disuccinimidyl carbonate (DSC) ( 1.10 equiv.) in dry DCM ( 0.35 M ) was treated dropwise over 20 min with a solution of the corresponding hydrazone ( 1.00 equiv.) in dry DCM ( 0.23 M ). The ice bath was removed, and the reaction mixture was allowed to warm to room temperature. After stirring for 1 h , the mixture was cooled to $0^{\circ} \mathrm{C}$ and treated dropwise with a premixed solution of the corresponding amino acid (1.00 equiv.) and DIPEA

[^0](2.00 equiv.) in DCM ( 0.8 M ). The ice bath was removed. The reaction mixture was allowed to warm to room temperature and stirred overnight. The crude mixture was diluted with 20 mL of sat. $\mathrm{NaHCO}_{3}$, extracted with DCM ( $3 \times 30 \mathrm{~mL}$ ), washed with brine ( 20 mL ), dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered, and concentrated under vacuum. The volatiles were evaporated, and the crude was purified on a column of silica gel using flash chromatography.

### 2.2 Starting amino acids and peptides characterization data

tert-Butyl (E)-(2-benzylidenehydrazine-1-carbonyl)-L-prolinate (2a)

Following general procedure $A$ and starting with DSC ( $581 \mathrm{mg}, 2.20 \mathrm{mmol}, 1.10$ equiv.), (E)benzaldehyde hydrazine ( $240 \mathrm{mg}, 2.00 \mathrm{mmol}, 1.00$ equiv.), H-Pro-OtBu ( $361 \mathrm{mg}, 2.00 \mathrm{mmol}$, 1.00 equiv.), DIPEA ( $697 \mu \mathrm{~L}, 4.00 \mathrm{mmol}, 2.00$ equiv.) and 17.6 mL of dry DCM, tert-Butyl (E)-(2-benzylidenehydrazine-1-carbonyl)-L-prolinate (2a) ( $400 \mathrm{mg}, 1.26 \mathrm{mmol}, 63 \%$ yield) was obtained as a white amorphous solid after purification by column chromatography on silica (DCM/MeOH 200:1).

Rf (DCM/MeOH 20:1): 0.35. ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 8.66$ (s, 1H), 7.76 (s, 1H,), 7.62 (dt, J $=8.4,2.2 \mathrm{~Hz}, 2 \mathrm{H}), 7.43-7.28(\mathrm{~m}, 3 \mathrm{H}), 4.73-4.65(\mathrm{~m}, 1 \mathrm{H}), 3.84-3.66(\mathrm{~m}, 2 \mathrm{H}), 2.22(\mathrm{dq}, \mathrm{J}=12.3$, $8.5 \mathrm{~Hz}, 1 \mathrm{H}), 2.12-1.85(\mathrm{~m}, 3 \mathrm{H}), 1.41(\mathrm{~s}, 9 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $\left.101 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 172.1,154.6,142.0$, 134.5, 129.5, 128.7, 127.2, 81.6, 61.0, 48.4, 30.5, 28.1, 23.7. ## 1-(tert-Butyl) 5-methyl (E)-(2-benzylidenehydrazine-1-carbonyl)-L-glutamate (21)

Following general procedure A and starting with DSC ( $436 \mathrm{mg}, 1.65 \mathrm{mmol}, 1.10$ equiv.), (E)benzaldehyde hydrazine ( $180 \mathrm{mg}, 1.50 \mathrm{mmol}, 1.00$ equiv.), H-Glu(OMe)-OtBu HCl ( 401 mg , $1.50 \mathrm{mmol}, 1.00$ equiv.), DIPEA ( $523 \mu \mathrm{~L}, 3.00 \mathrm{mmol}, 2.00$ equiv.) and 13.2 mL of dry DCM, 1-(tert-butyl) 5-methyl (E)-(2-benzylidenehydrazine-1-carbonyl)-L-glutamate (2I) (332 mg, $0.914 \mathrm{mmol}, 61 \%$ yield) was obtained as a colorless oil after purification by column chromatography on silica (DCM/MeOH 200:1 to DCM/MeOH 50:1).

Rf (DCM/MeOH 50:1): 0.10. ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 9.07$ (s, 1H), 7.73 (s, 1H), 7.66 (m, $2 \mathrm{H}), 7.44-7.32(\mathrm{~m}, 3 \mathrm{H}), 6.75(\mathrm{~d}, \mathrm{~J}=8.2 \mathrm{~Hz}, 1 \mathrm{H}), 4.54(\mathrm{td}, J=8.2,4.9 \mathrm{~Hz}, 1 \mathrm{H}), 3.66(\mathrm{~s}, 3 \mathrm{H}), 2.58-$ $2.37(\mathrm{~m}, 2 \mathrm{H}), 2.34-2.25(\mathrm{~m}, 1 \mathrm{H}), 2.07(\mathrm{~m}, 1 \mathrm{H}), 1.50(\mathrm{~s}, 9 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR (101 MHz, CDCl $\left.{ }^{2}\right) \delta 173.6$, 171.4, 155.9, 141.5, 134.0, 129.9, 128.8, 127.1, 82.4, 52.9, 51.9, 30.4, 28.4, 28.2. HRMS (ESI/QTOF) $\mathrm{m} / \mathrm{z}:[\mathrm{M}+\mathrm{Na}]^{+}$Calcd for $\mathrm{C}_{18} \mathrm{H}_{25} \mathrm{~N}_{3} \mathrm{NaO}_{5}{ }^{+} 386.1686$; Found 386.1680 . IR ( $\mathrm{v}_{\text {max }} \mathrm{cm}^{-}$ ${ }^{1}$ ) 3375 (w), 3201 (w), 3094 (w), 2959 (m), 1737 (s), 1672 (s), 1531 (s), 1368 (s), 1226 (m), 1153 (s), $917(w), 849(w), 757(m) .[\alpha]_{D}^{25}=+11.7\left(c=0.32, \mathrm{CHCl}_{3}\right)$.

## Methyl (E)-2-benzylidenehydrazine-1-carboxylate (2m)

Following a reported procedure, ${ }^{4}$ to a solution of methyl $N$-aminocarbamate ( $866 \mathrm{mg}, 9.42$ $\mathrm{mmol}, 1.00$ equiv) in ethanol ( 23.5 mL ) was added benzaldehyde ( $962 \mu \mathrm{~L}, 9.42 \mathrm{mmol}, 1.00$ equiv). The reaction mixture was stirred under reflux for 3 h . The solution was cooled to room temperature and the precipitate filtered (washed with hexane) under vacuum. Methyl ( $E$ )-2-benzylidenehydrazine-1-carboxylate ( 2 m ) ( $925 \mathrm{mg}, 5.19 \mathrm{mmol}, 55 \%$ yield) was collected as a white solid.
${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 8.52-8.19(\mathrm{~m}, 1 \mathrm{H}), 7.87(\mathrm{~s}, 1 \mathrm{H}), 7.73-7.61(\mathrm{~m}, 2 \mathrm{H}), 7.43-7.32(\mathrm{~m}$, $3 \mathrm{H}), 3.86(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $101 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta$ 154.6, 144.9, 133.7, 129.9, 128.5, 127.2, 52.8. Spectroscopic data was consistent with the values reported in the literature. ${ }^{5}$

## tert-Butyl (E)-2-benzylidenehydrazine-1-carboxylate (2n)

Following a reported procedure, ${ }^{4}$ to a solution of tert-butylcarbazate ( $1.27 \mathrm{~g}, 9.42 \mathrm{mmol}, 1.00$ equiv) in ethanol ( 23.5 mL ) was added benzaldehyde ( $962 \mu \mathrm{~L}, 9.42 \mathrm{mmol}, 1.00$ equiv). The reaction mixture was stirred under reflux for 3 h . The solution was cooled to room temperature and the precipitate filtered (washed with hexane) under vacuum. tert-Butyl (E)-2-benzylidenehydrazine-1-carboxylate ( 2 n ) ( $1.47 \mathrm{~g}, 6.67 \mathrm{mmol}, 71 \%$ yield) was collected as a white solid.
${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.90(\mathrm{~s}, 1 \mathrm{H}), 7.83(\mathrm{~s}, 1 \mathrm{H}), 7.70-7.66(\mathrm{~m}, 2 \mathrm{H}), 7.40-7.32(\mathrm{~m}, 3 \mathrm{H})$, $1.54(\mathrm{~s}, 9 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $101 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 152.4,143.7,134.0,130.0,128.7,127.3,81.6,28.4$. Spectroscopic data was consistent with the values reported in the literature. ${ }^{6}$

### 2.3 Procedures for the synthesis of EBX

The preparation of the following $\mathrm{BF}_{3} \mathrm{~K}$-alyknes and EBX reagents had been already described before. The procedures are taken here from the indicated publications to facilitate reproduction of the results by having all the data in the same file.

### 2.3.1 Synthesis of Potassium Trifluoroborate Salts

General note: It is known that carbons linked to the boron atom are difficult to be observed by ${ }^{13} \mathrm{C}$ NMR due to a broadening of the signal caused by the quadrupole moment of ${ }^{11} \mathrm{~B}$ nuclei.

[^1]This implies that the two carbons of the alkyne (in alkynyl- $\mathrm{BF}_{3} \mathrm{~K}$ ) are too broad to be properly visible. ${ }^{7}$ Therefore, they are not listed in the characterization data.

## General procedure B:

Following a reported procedure. ${ }^{8}$ An oven-dried round-bottom flask (PFA), charged with alkyne ( 1.0 equiv.) if solid, was evacuated and backfilled with $\mathrm{N}_{2}(3 \mathrm{x})$. Then, alkyne (if liquid) and dry THF ( 0.3 M ) were added. The mixture was cooled to $-78{ }^{\circ} \mathrm{C}$ and a solution of $n$-BuLi ( $2.5 \mathrm{M}, 1.0$ equiv.) in hexane was added dropwise under $\mathrm{N}_{2}$. The reaction was stirred at $-78^{\circ} \mathrm{C}$ for 1 h and $\mathrm{B}(\mathrm{Oi}-\mathrm{Pr})_{3}\left(1.5\right.$ equiv.) was added quickly. The reaction was stirred 10 min at $-78{ }^{\circ} \mathrm{C}$ then 2 h at rt . The mixture was cooled to $0^{\circ} \mathrm{C}$ and a saturated solution of $\mathrm{KHF}_{2}$ ( 6.0 equiv.) in water ( $40 \%$ of THF volume + additional $40 \%$ to rinse the remaining solid) was added. The reaction was stirred at rt open to air for 2 h then concentrated in vacuo. The wet solid obtained was further dried by co-evaporation with acetone. To the dry solid was added acetone ( $\sim 50 \mathrm{~mL}$ ) and the resulting mixture was placed on a rotary evaporator and rotated rapidly at atmospheric pressure with the bath set at $45{ }^{\circ} \mathrm{C}$ for 15 minutes. The flask was removed and the mixture carefully filtered taking care to leave the insoluble material in the reaction flask. Acetone was once again added and the process (heating for 15 min then collection of the liquid) was repeated 2 more times. The combined acetone filtrates were concentrated in vacuo to approximately $1 / 3$ of the initial volume. $\mathrm{Et}_{2} \mathrm{O}(\sim 60 \mathrm{~mL})$ was added causing a white solid to precipitate. The mixture was cooled to $0^{\circ} \mathrm{C}$ for 10 min then filtered. The solid obtained was washed with $\mathrm{Et}_{2} \mathrm{O}$ and dried in vacuo to afford the desired potassium alkynyltrifluoroborate.

Note: This purification procedure usually affords the pure desired product. If it is not the case a more classical recrystallization from acetone followed by precipitation with $\mathrm{Et}_{2} \mathrm{O}$ can be performed.

## Potassium trifluoro(mesitylethynyl)borate (10):

Synthesized following general procedure B, starting from 2-ethynyl-1,3,5-trimethylbenzene $(0.950 \mathrm{~g}, 1.03 \mathrm{~mL}, 6.3 \mathrm{mmol})$. Potassium trifluoro(mesitylethynyl)borate (10) ( $1.23 \mathrm{~g}, 4.94$ $\mathrm{mmol}, 78 \%$ ) was obtained as a white solid.
${ }^{1} \mathrm{H}$ NMR ( 400 MHz , acetone- $\mathrm{d}_{6}$ ) $\delta 6.79(\mathrm{~s}, 2 \mathrm{H}), 2.34(\mathrm{~s}, 6 \mathrm{H}), 2.20(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( 101 MHz , acetone- $\mathrm{d}_{6}$ ) $\delta 140.0,135.9,127.9,124.0,21.3,21.2 .{ }^{19} \mathrm{~F}$ NMR ( 377 MHz , acetone- $\mathrm{d}_{6}$ ) $\delta$-134.3.

[^2]${ }^{11}$ B NMR ( 128 MHz , acetone- $\mathrm{d}_{6}$ ) $\delta-1.0(\mathrm{q}, \mathrm{J}=37.3 \mathrm{~Hz}$ ). Spectroscopic data was consistent with the values reported in the literature. ${ }^{8}$

## Potassium trifluoro(prop-1-yn-1-yl)borate (12)

Following a reported procedure. ${ }^{8}$ An oven-dried round-bottom flask (PFA) was evacuated and backfilled with $\mathrm{N}_{2}(3 \mathrm{x})$. Then, a solution of 1-propynylmagnesium bromide (11) ( $15 \mathrm{~mL}, 7.5$ $\mathrm{mmol}, 0.5 \mathrm{M}, 1.0$ equiv.) in THF and dry THF ( 15 mL ) were added. The solution was cooled to $-78^{\circ} \mathrm{C}$ and $\mathrm{B}(\mathrm{OMe})_{3}\left(1.25 \mathrm{~mL}, 11.3 \mathrm{mmol}, 1.5\right.$ equiv.) was added quickly under $\mathrm{N}_{2}$. The reaction was stirred 1 h at $-78^{\circ} \mathrm{C}$ then 1.5 h at $-20^{\circ} \mathrm{C}$. A saturated solution of $\mathrm{KHF}_{2}(3.5 \mathrm{~g}, 45 \mathrm{mmol}, 6.0$ equiv.) in water ( $10 \mathrm{~mL}+$ additional 10 mL to rinse the remaining solid) was added. The reaction was stirred at rt open air for 2 h then concentrated in vacuo. The wet solid obtained was further dried by co-evaporation with acetone. To the dry solid was added acetone (~30 mL ) and the resulting mixture was placed on a rotary evaporator and rotated rapidly at atmospheric pressure with the bath set at $45{ }^{\circ} \mathrm{C}$ for 15 minutes. The flask was removed and the mixture carefully filtered taking care to leave the insoluble material in the reaction flask. Acetone was once again added and the process (heating for 15 min then collection of the liquid) was repeated 2 more times. The combined acetone filtrates were concentrated in vacuo to approximately $1 / 3$ of the initial volume. $\mathrm{Et}_{2} \mathrm{O}(\sim 30 \mathrm{~mL})$ was added causing a white solid to precipitate. The mixture was cooled to $0^{\circ} \mathrm{C}$ for 10 min then filtered. The solid obtained was washed with $\mathrm{Et}_{2} \mathrm{O}$ and dried in vacuo to afford potassium trifluoro(prop-1-yn-1-yl)borate (12) ( $0.95 \mathrm{~g}, 6.5 \mathrm{mmol}, 87 \%$ ) as a white solid.
${ }^{1} \mathrm{H}$ NMR (400 MHz, acetone- $\mathrm{d}_{6}$ ) $\delta 1.64-1.58(\mathrm{~m}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( 101 MHz , acetone- $\mathrm{d}_{6}$ ) $\delta 4.0$. ${ }^{19}$ F NMR ( 376 MHz , acetone- $\mathrm{d}_{6}$ ) $\delta-134.7$ (dd, $J=76.0,37.4 \mathrm{~Hz}$ ). ${ }^{11}$ B NMR ( 128 MHz , acetone$\mathrm{d}_{6}$ ) $\delta-1.7(\mathrm{q}, J=38.2 \mathrm{~Hz})$. Spectroscopic data was consistent with the values reported in the literature. ${ }^{8}$

## Potassium (cyclopropylethynyl)trifluoroborate (13)

Synthesized following general procedure B, starting from ethynylcyclopropane ( $0.50 \mathrm{~g}, 0.64$ $\mathrm{mL}, 7.5 \mathrm{mmol})$. Potassium (cyclopropylethynyl)trifluoroborate (13) ( $0.86 \mathrm{~g}, 5.0 \mathrm{mmol}, 67 \%$ ) was obtained as a white solid.
${ }^{1} \mathrm{H}$ NMR ( 400 MHz, DMSO- $\mathrm{d}_{6}$ ) $\delta 1.12-1.01(\mathrm{~m}, 1 \mathrm{H}), 0.61-0.54(\mathrm{~m}, 2 \mathrm{H}), 0.42-0.36(\mathrm{~m}, 2 \mathrm{H})$. ${ }^{13} \mathrm{C}$ NMR ( $101 \mathrm{MHz}, \mathrm{DMSO}_{-} \mathrm{d}_{6}$ ) $\delta 7.4,0.1 .{ }^{19} \mathrm{~F}$ NMR ( 377 MHz , DMSO- $\mathrm{d}_{6}$ ) $\delta-131.1 .{ }^{11} \mathrm{~B}$ NMR ( $128 \mathrm{MHz}, \mathrm{DMSO}-\mathrm{d}_{6}$ ) $\delta-2.1$ ( $\mathrm{q}, \mathrm{J}=37.5 \mathrm{~Hz}$ ). Spectroscopic data was consistent with the values reported in the literature. ${ }^{8}$

Synthesized following general procedure $B$, starting from 5-chloropent-1-yne ( $0.77 \mathrm{~g}, 0.80 \mathrm{~mL}$, 7.5 mmol ). Potassium (5-chloropent-1-yn-1-yl)trifluoroborate (14) ( $1.28 \mathrm{~g}, 6.14 \mathrm{mmol}, 82 \%$ ) was obtained as a white solid.
${ }^{1} \mathrm{H}$ NMR ( 400 MHz , acetone- $\mathrm{d}_{6}$ ) $\delta 3.70(\mathrm{t}, \mathrm{J}=6.6 \mathrm{~Hz}, 2 \mathrm{H}), 2.24-2.17(\mathrm{~m}, 2 \mathrm{H}), 1.85(\mathrm{p}, \mathrm{J}=6.7$ $\mathrm{Hz}, 2 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( 101 MHz , acetone- $\mathrm{d}_{6}$ ) $\delta 44.9,33.1,17.3 .{ }^{19} \mathrm{~F}$ NMR ( 376 MHz , acetone- $\mathrm{d}_{6}$ ) $\delta$ -134.6 . Spectroscopic data was consistent with the values reported in the literature. ${ }^{9}$

### 2.3.2 Procedures for the synthesis of EBX

## 1-[Hydroxy]-1,2-benziodoxol-3-(1H)-one (16)

Following a reported procedure. $8 \mathrm{NaIO}_{4}$ ( 18.1 g , $84.7 \mathrm{mmol}, 1.05$ equiv) and 2-iodobenzoic acid (15) ( $20.0 \mathrm{~g}, 80.6 \mathrm{mmol}, 1.00$ equiv) were suspended in a mixture of $\mathrm{AcOH}(36 \mathrm{~mL})$ and water ( 84 mL ). The mixture was vigorously stirred and refluxed for 4 h . The reaction mixture was then diluted with cold water ( 100 mL ) and allowed to cool to room temperature protected from light. The crude product was collected by filtration, washed on the filter with ice water ( $3 \times 50 \mathrm{~mL}$ ) and acetone ( $3 \times 50 \mathrm{~mL}$ ), and air-dried in the dark to give the pure product 16 ( $20.0 \mathrm{~g}, 75.7 \mathrm{mmol}, 94 \%$ ) as a white solid.
${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, ~ D M S O-\mathrm{d}_{6}$ ): $\delta 8.02$ (dd, $J=7.7,1.4 \mathrm{~Hz}, 1 \mathrm{H}$ ), 7.97 (m, 1H), 7.85 (dd, J = 8.2, $0.7 \mathrm{~Hz}, 1 \mathrm{H}$ ), 7.71 (td, J = 7.6, 1.2 Hz, 1H). ${ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz}, \mathrm{DMSO}_{\mathrm{d}}$ ): $\delta 167.7,134.5,131.5$, $131.1,130.4,126.3,120.4$. Spectroscopic data was consistent with the values reported in the literature. ${ }^{8}$

## 1-[p-Methylbenzenesulfonyloxy]-1,2-benziodoxol-3-(1H)-one (17)

Following a reported procedure. ${ }^{8} \mathrm{pTsOH} \cdot \mathrm{H}_{2} \mathrm{O}(5.71 \mathrm{~g}, 30.0 \mathrm{mmol}, 2.0$ equiv.) was added portionwise to an oven-dried flask containing a suspension of 1-[Hydroxy]-1,2-benziodoxol3 -(1H)-one (16) ( $3.96 \mathrm{~g}, 15.0 \mathrm{mmol}, 1.0$ equiv.) in acetic anhydride ( 15 mL ). After 5 min , a slightly exothermic reaction began and the mixture turned into a clear slightly yellow solution.

[^3]The reaction was stirred at rt under $\mathrm{N}_{2}$ for 3 h . During the course of the reaction precipitation of the product as a white solid might occur. $\mathrm{Dry}_{\mathrm{Et}}^{2} \mathrm{O}(40 \mathrm{~mL})$ was added and the mixture was cooled to $0^{\circ} \mathrm{C}$ for 10 min . At this point precipitation of the product should have occurred. The solid was filtered and washed with dry $\mathrm{Et}_{2} \mathrm{O}(4 \times 40 \mathrm{~mL})$ then dried in vacuo to afford 1-[p-methylbenzenesulfonyloxy]-1,2-benziodoxol-3-(1H)-one (17) (4.75 g, $11.4 \mathrm{mmol}, 76 \%$ ) as a white solid.

Note: The product is slightly hygroscopic, when filtering it using vacuum filtration it is advised to avoid extensive drying on the frit. Just removing the ether is enough to collect it properly and further drying can be carried in vacuo.
${ }^{1} \mathrm{H}$ NMR ( 400 MHz, DMSO- $\mathrm{d}_{6}$ ) $\delta 8.01(\mathrm{dd}, J=7.5,1.5 \mathrm{~Hz}, 1 \mathrm{H}$ ), $7.98-7.93(\mathrm{~m}, 1 \mathrm{H}), 7.83(\mathrm{dd}, J=$ 8.1, $0.9 \mathrm{~Hz}, 1 \mathrm{H}$ ), 7.70 (td, J = 7.4, 1.0 Hz, 1H), 7.51-7.46 (m, 2H), 7.15-7.10 (m, 2H), 2.28 (s, 3H). ${ }^{13} \mathrm{C}$ NMR ( 101 MHz, DMSO-d ${ }_{6}$ ) $\delta 167.9,145.2,138.1,134.6,131.5,131.2,130.5,128.3$, $126.4,125.6,120.5,20.9$. Spectroscopic data was consistent with the values reported in the literature. ${ }^{10}$

Note: We observed a slow solubilization of $\mathbf{1 7}$ if dry DMSO is used. We think water present in DMSO help the solubilization and that when dry DMSO is used the solubilization happen after a couple of minutes ( $\sim 5 \mathrm{~min}$ ) due to the progressive absorption of the water present in the air by the solvent.

## 1-[(Triisopropylsilyl)ethynyl]-1,2-benziodoxol-3-(1H)-one (3a)

Following a reported procedure, ${ }^{11}$ a 250 mL , three-necked, round-bottomed flask was equipped with a Teflon-coated magnetic stirrer ( 2 cm ), a Liebig reflux condenser (open to air), and a septum. The septum was removed, and the flask was charged with o-iodobenzoic acid (15) ( $6.00 \mathrm{~g}, 24.2 \mathrm{mmol}, 1.00$ equiv), $p$-toluenesulfonic acid monohydrate ( $4.60 \mathrm{~g}, 24.2 \mathrm{mmol}$, 1.00 equiv), 1,2-dichloroethane ( 36.3 mL ), and trifluoroethanol ( 36.3 mL ). The resulting white suspension was stirred ( 600 rpm ) at room temperature. mCPBA ( $\leq 77 \%$ purity; $5.96 \mathrm{~g}, 26.6$ $\mathrm{mmol}, \leq 1.10$ equiv) was added in portions over a period of 10 min . During the addition, the suspension slightly darkened, becoming beige. After the addition of $m$ CPBA, the septum was replaced, and the flask was placed in dry-sin preheated to $55^{\circ} \mathrm{C}$ and stirred ( 600 rpm ). The mixture turned from a white suspension to a clear yellow color solution over a period of 5 min. After 1.5 h , (triisopropylsilyl)acetylene (18) ( $7.60 \mathrm{~mL}, 33.9 \mathrm{mmol}, 1.40$ equiv) was added dropwise via a 10 mL syringe over a period of 5 min and stirring was continued at $55^{\circ} \mathrm{C}$ for

[^4]another 24 h . After this time, the pale-yellow solution was allowed to cool down to room temperature. Saturated aq. $\mathrm{NaHCO}_{3}(120 \mathrm{~mL})$ was then added: a pinkish mixture was formed with significant bubbling. This biphasic mixture was stirred ( 1000 rpm ) at room temperature for 1 h . The mixture was transferred to a 250 mL separatory funnel, and the reaction flask was rinsed with dichloromethane ( 12 mL ). The two layers were separated, and the aqueous layer was extracted with additional portions of dichloromethane ( $3 \times 40 \mathrm{~mL}$ ). The combined organic layers were washed with water ( $3 \times 50 \mathrm{~mL}$ ), prior to being dried over $\mathrm{MgSO}_{4}$ (ca. 3.0 g ), filtered into a 250 mL round-bottomed flask, and concentrated via rotary evaporation, to provide an off-white solid. The latter was purified by recrystallization from acetonitrile $(12 \mathrm{~mL})$ to provide 1-[(triisopropylsilyl)ethynyl]-1,2-benziodoxol-3-(1H)-one (3a) (8.36 g, $19.5 \mathrm{mmol}, 81 \%$ yield) as a crystalline, white solid.
${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 8.42(\mathrm{dd}, \mathrm{J}=5.9,3.2 \mathrm{~Hz}, 1 \mathrm{H}), 8.34-8.25(\mathrm{~m}, 1 \mathrm{H}), 7.80-7.72(\mathrm{~m}$, $2 \mathrm{H}), 1.27-1.06(\mathrm{~m}, 21 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $101 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 166.5,134.6,132.3,131.4,131.4,126.1$, 115. $6,114.0,64.6,18.4,11.1$. Spectroscopic data was consistent with the values reported in the literature. ${ }^{11}$

## 1-[Phenylethynyl]-1,2-benziodoxol-3-(1H)-one (3b)

Following a reported procedure. ${ }^{12}$ Trimethylsilyltriflate ( $9.1 \mathrm{~mL}, 50 \mathrm{mmol}, 1.1$ equiv) was added dropwise to a suspension of 1-[hydroxy]-1,2-benziodoxol-3-(1H)-one (16) (12.1 g, 45.8 mmol, 1.0 equiv) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(120 \mathrm{~mL})$ at $0^{\circ} \mathrm{C}$. The mixture was stirred for 1 h , followed by the dropwise addition of trimethyl(phenylethynyl)silane (19) ( $8.8 \mathrm{~mL}, 50 \mathrm{mmol}, 1.1$ equiv) (slightly exothermic). The resulting suspension was stirred for 6 h at rt , during this time a white solid was formed. A saturated solution of $\mathrm{NaHCO}_{3}(120 \mathrm{~mL})$ was added and the mixture was stirred vigorously for 30 min . The two layers of the mother liquors were separated and the organic layer was washed with sat. $\mathrm{NaHCO}_{3}(2 \times 50 \mathrm{~mL})$, dried over $\mathrm{MgSO}_{4}$, filtered and evaporated under reduced pressure. The resulting solid was recrystalized in $\mathrm{EtOAc}: \mathrm{MeOH}(7: 3 \mathrm{v}: \mathrm{v}$ ) (ca. 20 mL ). The solution was left to cool to rt then in the freezer overnight, filtered and dried under high vacuum to afford 1-[phenylethynyl]-1,2-benziodoxol-3-(1H)-one (3b) (6.8 g, 25 mmol , $43 \%$ yield) as colorless crystals.
${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 8.46(\mathrm{~m}, 1 \mathrm{H}), 8.28(\mathrm{~m}, 1 \mathrm{H}), 7.80(\mathrm{~m}, 2 \mathrm{H}), 7.63(\mathrm{~m}, 2 \mathrm{H}), 7.48(\mathrm{~m}$, 3H). ${ }^{13}$ C NMR ( $101 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 163.9,134.9,132.9,132.5,131.6,131.3 .130 .8,128.8,126.2$, $120.5,116.2,106.6,50.2$. Spectroscopic data was consistent with the values reported in the literature. ${ }^{12}$

## 1-[(2-Bromophenyl)ethynyl]-1,2-benziodoxol-3-(1H)-one (3e)

[^5]

Following a reported procedure. ${ }^{12}$ Trimethylsilyl triflate ( $0.42 \mathrm{~mL}, 2.4 \mathrm{mmol}, 1.1$ equiv) was added to a suspension of 1-[hydroxy]-1,2-benziodoxol-3-(1H)-one (16) ( $0.562 \mathrm{~g}, 2.13 \mathrm{mmol}$, 1.00 equiv) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(6 \mathrm{~mL})$ at rt . The resulting suspension was stirred for 1 h , followed by the drop wise addition of ((2-bromophenyl)ethynyl)trimethylsilane (20) ( $0.50 \mathrm{~mL}, 2.4 \mathrm{mmol}, 1.1$ equiv). The resulting suspension was stirred for 6 h at rt . A saturated solution of $\mathrm{NaHCO}_{3}$ ( 10 mL ) was then added and the mixture was stirred vigorously for 1 h resulting in a persistent emulsion/suspension. The mixture was diluted with $\mathrm{CHCl}_{3}(10 \mathrm{~mL})$, water ( 5 mL ) and MeOH (ca. 2 mL ) to afford 2 distinct layers. The two layers were separated, and the organic layer was washed with sat. $\mathrm{NaHCO}_{3}(5 \mathrm{~mL})$, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered, and evaporated under reduced pressure. The resulting solid was recrystallized in EtOAc:MeOH (7:3 v:v) (ca. 20 mL ). The solution was left to cool to rt then was placed in the freezer $\left(-20^{\circ} \mathrm{C}\right)$ overnight. The crystals were filtered and washed with $\mathrm{Et}_{2} \mathrm{O}$ to afford 1-[(2-bromophenyl)ethynyl]-1,2-benziodoxol-3( 1 H )-one ( 3 e ) ( $1.50 \mathrm{~g}, 3.51 \mathrm{mmol}, 70 \%$ yield) as colorless crystals.
${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 8.44$ (td, $J=7.3,2.1 \mathrm{~Hz}, 2 \mathrm{H}$ ), $7.84-7.74(\mathrm{~m}, 2 \mathrm{H}), 7.68(\mathrm{~d}, \mathrm{~J}=1.1$ $\mathrm{Hz}, 1 \mathrm{H}), 7.61$ (dd, J = 7.6, 1.7 Hz, 1 H ), 7.36 ( $\mathrm{m}, 2 \mathrm{H}$ ). ${ }^{13} \mathrm{C}$ NMR ( $101 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 166.6,135.2$, 134.7, 133.0, 132.7 , 131.8, 131.3, 127.6, 126.8, 126.4, 123.2, 116.5, 104.3, 55.4. Spectroscopic data was consistent with the values reported in the literature. ${ }^{12}$

General procedure C for the purification-free synthesis of EBX reagents on $\mathbf{0 . 4} \mathbf{~ m m o l}$ scales
Following a reported procedure. ${ }^{8}$ A capped oven dried microwave vial charged with 1-( $p$ -methylbenzenesulfonyloxy)-1,2-benziodoxol-3-(1H)-one (17) (167 mg, $0.400 \mathrm{mmol}, 1.0$ equiv.) and potassium alkynyltrifluoroborate ( $0.50 \mathrm{mmol}, 1.25$ equiv.) was evacuated and backfilled with $\mathrm{N}_{2}(3 \mathrm{x})$. Dry acetonitrile ( 4 mL ) was added under $\mathrm{N}_{2}$ and the reaction was stirred at rt for 1 h . To the mixture was added a sat. sol. of $\mathrm{NaHCO}_{3}(8 \mathrm{~mL})$ and the mixture was vigorously stirred open to air for 1 h . Water ( 10 mL ) was added and the mixture was extracted with $3 \times 20 \mathrm{~mL}$ of DCM, the combined organic layers were dried over $\mathrm{MgSO}_{4}$, filtered and concentrated in vacuo. The crude EBX was triturated in pentane, which induced precipitation if it was an oil. The pentane layer was discarded with care to leave the solid in the flask. This process was repeated 2 more times then the solid was dried in vacuo to afford the desired compounds.

Note: Purity of the product obtained was determined using ${ }^{1} \mathrm{H}$ NMR by dissolving the entirety of the compound in $\mathrm{CDCl}_{3}(\sim 4 \mathrm{~mL})$ and adding $\mathrm{CH}_{2} \mathrm{Br}_{2}(14.0 \mu \mathrm{~L}, 0.1975 \mathrm{mmol}, 0.49$ equiv.) as internal standard.

Purity is determined based on the signal of $\mathrm{CH}_{2} \mathrm{Br}_{2}(4.93 \mathrm{ppm})$ normalize at $\mathrm{I}=1$ and an aromatic signal of the EBX corresponding to 1 H :

$$
\begin{gathered}
n(E B X)_{e f f}=\frac{\frac{I_{E B X}}{N_{E B X}} * n_{s t d} * N_{s t d}}{I_{s t d}}=\frac{\frac{I_{E B X}}{1} * 0.1975 * 2}{1}=I_{E B X} * 0.3950 \\
p_{E B X}=\frac{n(E B X)_{\text {eff }}}{n(E B X)_{\text {theo }}}=\frac{n(E B X)_{\text {eff }}}{\frac{m_{E B X}}{M W_{E B X}}}
\end{gathered}
$$

$\mathrm{n}(\mathrm{EBX})_{\text {eff: }}$ moles of EBX determined by NMR (in mmol).
$\mathrm{n}(E B X)_{\text {theo }}$ : moles of $E B X$ calculated from the mass obtained if $100 \%$ pure (in mmol).
$I_{\text {Ebx: }}$ Integral of the EBX signal.
Istd: Integral of the standard $\left(\mathrm{CH}_{2} \mathrm{Br}_{2}\right)$ signal.
$N_{\text {EBx }}$ : Number of protons corresponding the EBX signal.
$\mathrm{N}_{\text {std: }}$ : Number of protons corresponding the standard $\left(\mathrm{CH}_{2} \mathrm{Br}_{2}\right)$ signal.
$m_{E B X}$ : mass of $E B X$ obtained at the end of the reaction (in mg ).
MW $_{\text {EBX: }}$ : Molecular weight of the EBX (in $\mathrm{mg} / \mathrm{mmol}$ )
$p_{\text {Ebx: }}$ purity of the EBX
General procedure $D$ for the purification-free synthesis of EBX reagents on 0.5 mmol scales
Following an adapted version of a reported procedure. ${ }^{8}$ A capped oven dried microwave vial charged with 1-(p-methylbenzenesulfonyloxy)-1,2-benziodoxol-3-(1H)-one (17) (209 mg, $0.500 \mathrm{mmol}, 1.0$ equiv.) and potassium alkynyltrifluoroborate ( $0.625 \mathrm{mmol}, 1.25$ equiv.) was evacuated and backfilled with $\mathrm{N}_{2}(3 x)$. Dry acetonitrile ( 5 mL ) was added under $\mathrm{N}_{2}$ and the reaction was stirred at rt for 1 h . To the mixture was added a sat. sol. of $\mathrm{NaHCO}_{3}(8 \mathrm{~mL})$ and the mixture was vigorously stirred open to air for 1 h . Water ( 10 mL ) was added and the mixture was extracted with $3 \times 20 \mathrm{~mL}$ of DCM, the combined organic layers were dried over $\mathrm{MgSO}_{4}$, filtered and concentrated in vacuo. The crude EBX was triturated in pentane, which induced precipitation if it was an oil. The pentane layer was discarded with care to leave the solid in the flask. This process was repeated 2 more times then the solid was dried in vacuo to afford the desired compounds.

Note: Purity of the product obtained was determined using ${ }^{1} \mathrm{H}$ NMR by dissolving the entirety of the compound in $\mathrm{CDCl}_{3}$ ( $\sim 4 \mathrm{~mL}$ ) and adding $\mathrm{CH}_{2} \mathrm{Br}_{2}(17.5 \mu \mathrm{~L}, 0.2469 \mathrm{mmol}, 0.49$ equiv.) as internal standard.

Purity is determined based on the signal of $\mathrm{CH}_{2} \mathrm{Br}_{2}(4.93 \mathrm{ppm})$ normalize at $\mathrm{I}=1$ and an aromatic signal of the EBX corresponding to 1 H :

$$
\begin{gathered}
n(E B X)_{e f f}=\frac{\frac{I_{E B X}}{N_{E B X}} * n_{s t d} * N_{s t d}}{I_{s t d}}=\frac{\frac{I_{E B X}}{1} * 0.2469 * 2}{1}=I_{E B X} * 0.4938 \\
p_{E B X}=\frac{n(E B X)_{e f f}}{n(E B X)_{\text {theo }}}=\frac{n(E B X)_{e f f}}{\frac{m_{E B X}}{M W_{E B X}}}
\end{gathered}
$$

## 1-[Mesitylethynyl]-1,2-benziodoxol-3-(1H)-one (3c)

Synthesized following general procedure C, starting from potassium trifluoro(mesitylethynyl)borate (10) ( $125 \mathrm{mg}, 0.500 \mathrm{mmol}$ ). The reaction was stirred at rt for 2 h .1 -[Mesitylethynyl]-1,2-benziodoxol-3-(1H)-one (3c) ( $148.2 \mathrm{mg}, 0.3792 \mathrm{mmol}, 95 \%, 99 \%$ purity) was obtained as a white solid.
${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 8.46-8.38(\mathrm{~m}, 1 \mathrm{H}),, 8.33-8.25(\mathrm{~m}, 1 \mathrm{H}), 7.79-7.71(\mathrm{~m}, 2 \mathrm{H}), 6.95$ $(\mathrm{s}, 2 \mathrm{H}), 2.47(\mathrm{~s}, 6 \mathrm{H}), 2.34(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $101 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 166.7,142.4,141.0,134.9,132.7$, $131.7,131.6,128.3,126.2,117.6,116.7,105.6,55.7,21.7,21.3$. ## 3. Optimization of the alkynylation of azapeptides

tert-Butyl (E)-(2-benzylidenehydrazine-1-carbonyl)-L-prolinate 2a was chosen as substrate on a 0.05 mmol scale.

## General method for the optimization of the reaction

An oven-dried 5 mL microwave vial equipped with a magnetic stirring bar was charged under air with TIPS-EBX ( $21.4 \mathrm{mg}, 50.0 \mu \mathrm{~mol}, 1.00$ equiv.), the corresponding base ( $75.0 \mu \mathrm{~mol}, 1.50$ equiv.), tert-butyl (E)-(2-benzylidenehydrazine-1-carbonyl)-L-prolinate ( $15.9 \mathrm{mg}, 50.0 \mu \mathrm{~mol}$, 1.00 equiv.) and the corresponding catalyst ( $2.50 \mu \mathrm{~mol}, 5 \mathrm{~mol} \%$ ). The vial was capped and 500 $\mu \mathrm{L}$ of dry solvent was added. The heterogeneous mixture was vigorously stirred at the indicated temperature for 1 hour. After this time, the reaction was cooled down to room temperature, and the mixture was filtered over a pad of Celite ${ }^{\circledR}$ using DCM to rinse ( $\approx 10 \mathrm{~mL}$ ) and concentrated under reduced pressure. The crude residue was then purified by preparative thin-layer chromatography (DCM/MeOH 100:1).

Table S1. Optimization of the azapeptide alkynylation.

${ }^{\text {a }}$ TIPS-EBX (1.5 equiv.). ${ }^{\mathrm{b}}$ No conversion of both starting materials. ${ }^{\mathrm{c}}$ decomposition of $\mathbf{2 a}$.

## 4. Scope of the reaction

## Unsucessful EBX reagents:

Figure S1. List of unsuccessful EBX reagents tested.

### 4.1 General procedures

## General procedure $E$ for the alkynylation reaction done on 0.3 mmol scale

An oven-dried 5 mL microwave vial equipped with a magnetic stirring bar was charged under air with the corresponding EBX ( $0.300 \mathrm{mmol}, 1.00$ equiv.), $\mathrm{Cs}_{2} \mathrm{CO}_{3}(147 \mathrm{mg}, 0.450 \mathrm{mmol}, 1.50$ equiv.), the chosen substrate ( $0.300 \mathrm{mmol}, 1.00$ equiv.) and $\mathrm{Cul}(2.90 \mathrm{mg}, 15.0 \mu \mathrm{~mol}, 5 \mathrm{~mol} \%$ ). The vial was capped and 3.00 mL of dry DCM was added. The heterogeneous mixture was vigorously stirred at $40^{\circ} \mathrm{C}$ for 1 hour. After this time, the reaction was cooled down to room temperature, and the mixture was filtered over a pad of Celite ${ }^{\circledR}$ using DCM to rinse ( $\approx 50 \mathrm{~mL}$ ) and concentrated under reduced pressure. The crude residue was then purified by column chromatography on silica gel.

### 4.2 Characterization data

tert-Butyl (E)-(2-benzylidene-1-((triisopropylsilyl)ethynyl)hydrazine-1-carbonyl)-L-prolinate (4a)

Synthesized from tert-butyl (E)-(2-benzylidenehydrazine-1-carbonyl)-L-prolinate (2a) (95.0 $\mathrm{mg}, 0.300 \mathrm{mmol}, 1.00$ equiv.) and TIPS-EBX (3a) ( $129 \mathrm{mg}, 0.300 \mathrm{mmol}, 1.00$ equiv.) following general procedure E. tert-Butyl (E)-(2-benzylidene-1-((triisopropylsilyl)ethynyl)hydrazine-1-carbonyl)-L-prolinate (4a) ( $113 \mathrm{mg}, 0.227 \mathrm{mmol}, 76 \%$ yield) was obtained as a yellowish oil after purification by column chromatography on silica (DCM/MeOH 200:1).

## 5. Post-functionalizations

### 5.1 Hydration

To a microwave vial containing a solution of tert-butyl (E)-(2-benzylidene-1-((triisopropylsilyl)ethynyl)hydrazine-1-carbonyl)-L-glycinate (4b) ( $46 \mathrm{mg}, 0.050 \mathrm{mmol}, 1.0$ equiv.) in a mixture of THF ( 1.8 mL ) and $\mathrm{H}_{2} \mathrm{O}(0.2 \mathrm{~mL})$ was added $p \mathrm{TsOH} \bullet \mathrm{H}_{2} \mathrm{O}(0.13 \mathrm{~g}, 0.35$ $\mathrm{mmol}, 7.0$ equiv.). The reaction was stirred at rt open to air for 16 h . The mixture was diluted with DCM ( 5 mL ) and quenched with the addition of a 1 M aq. Sol. Of $\mathrm{NaOH}(10 \mathrm{~mL})$. The mixture was extracted with $3 \times 10 \mathrm{~mL}$ of DCM. The combined organic layers were washed with brine, dried over $\mathrm{MgSO}_{4}$, filtered and concentrated in vacuo. The crude oil was purified by
preparative TLC (DCM) to afford tert-butyl (E)-(2-benzylidene-1-(2-(triisopropylsilyl)acetyl)hydrazine-1-carbonyl)glycinate (6) (20 mg, $0.042 \mathrm{mmol}, 42 \%$ ) as a colorless oil.

Rf (DCM): 0.62. ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 9.35(\mathrm{t}, \mathrm{J}=5.1 \mathrm{~Hz}, 1 \mathrm{H}), 8.50(\mathrm{~s}, 1 \mathrm{H}), 7.79-7.74$ (m, 2H), $7.50-7.39(\mathrm{~m}, 3 \mathrm{H}), 4.00(\mathrm{~d}, \mathrm{~J}=5.4 \mathrm{~Hz}, 2 \mathrm{H}), 2.55(\mathrm{~s}, 2 \mathrm{H}), 1.48(\mathrm{~s}, 9 \mathrm{H}), 1.23-1.03(\mathrm{~m}$, $21 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $101 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 177.8,168.6,162.9,153.1,133.5,131.6,128.8,128.5,82.2$, 43.3, 28.2, 21.1, 18.5, 11.6. HRMS (ESI/QTOF) $\mathrm{m} / \mathrm{z}: \quad[\mathrm{M}+\mathrm{Na}]^{+}$Calcd for $\mathrm{C}_{25} \mathrm{H}_{41} \mathrm{~N}_{3} \mathrm{NaO}_{4} \mathrm{Si}^{+}$498.2759; Found 498.2763. IR $\left(\mathrm{v}_{\text {max }} \mathrm{cm}^{-1}\right) 3274(\mathrm{w}), 2943(\mathrm{~m}), 2867(\mathrm{~m})$, 2254 ( w ), 1745 (m), 1708 ( s$), 1657$ (m), 1512 (m), 1367 ( s$), 1224$ ( s$), 1154$ ( s$), 883$ (m), 769 (m), 755 (m).

### 5.2 5-endo-dig Cyclization

A capped oven dried microwave vial charged with tert-Butyl (E)-(2-benzylidene-1-(phenylethynyl)hydrazine-1-carbonyl)glycinate (5a) ( $18.8 \mathrm{mg}, 50.0 \mu \mathrm{~mol}, 1.0$ equiv.), Cul ( 1.0 $\mathrm{mg}, 5.0 \mu \mathrm{~mol}, 0.1$ equiv.) and $\mathrm{Cs}_{2} \mathrm{CO}_{3}(24.4 \mathrm{mg}, 75.0 \mu \mathrm{~mol}, 1.5$ equiv.) was evacuated and backfilled with $\mathrm{N}_{2}(3 \mathrm{x})$. Then, dry DCE $(0.5 \mathrm{~mL})$ was added and the reaction was stirred at 60 ${ }^{\circ} \mathrm{C}$ for 6 h . The mixture was filtered over a pad of Celite ${ }^{\circledR}$ using DCM to rinse ( $\approx 10 \mathrm{~mL}$ ). The solution was concentrated in vacuo and the crude oil was purified by preparative TLC (Pentane/EtOAc, 85:15) to afford tert-butyl (E)-2-(3-(benzylideneamino)-2-oxo-5-phenyl-2,3-dihydro-1H-imidazol-1-yl)acetate (7) ( $11.8 \mathrm{mg}, 31.3 \mu \mathrm{~mol}, 63 \%$ ) as a yellow oil.

Rf (DCM): 0.59. ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 9.77(\mathrm{~s}, 1 \mathrm{H}), 7.81-7.72(\mathrm{~m}, 2 \mathrm{H}), 7.49-7.44(\mathrm{~m}$, 2H), $7.43-7.35(\mathrm{~m}, 5 \mathrm{H}), 7.33(\mathrm{~s}, 1 \mathrm{H}), 7.31-7.27(\mathrm{~m}, 1 \mathrm{H}), 4.26(\mathrm{~s}, 2 \mathrm{H}), 1.52(\mathrm{~s}, 9 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $101 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 170.6,150.1,148.8,138.6,134.7,130.3,128.9,128.7,128.2,127.6,127.3$, 123.0, 111.7, 81.1, 49.6, 28.3. HRMS (ESI/QTOF) m/z: [M + H]+ Calcd for $\mathrm{C}_{22} \mathrm{H}_{24} \mathrm{~N}_{3} \mathrm{O}_{3}{ }^{+} 378.1812$; Found 378.1813. IR ( $\mathrm{v}_{\max ,} \mathrm{cm}^{-1}$ ) $2978(\mathrm{w}), 2256(\mathrm{w}), 1743(\mathrm{~s}), 1693(\mathrm{~s})$, 1651 (m), 1450 (m), 1405 (m), 1368 (m), 1218 (m), 1153 (s), 1022 (m), 912 (m), 754 (m).

### 5.3 Huisgen [3+2]-cycloadditions

 $\mathrm{BnN}_{3}$ (1 eq.)
$\mathrm{CuSO}_{4} 5 \mathrm{H}_{2} \mathrm{O}$ (0.3 eq.) Na -ascorbate ( 0.5 eq .) $\mathrm{Et}_{3} \mathrm{~N}$ (1.2 eq)
$\mathrm{EtOH} / \mathrm{H}_{2} \mathrm{O}(1: 1), 2 \mathrm{~h}, \mathrm{rt}$

8

To a $0^{\circ} \mathrm{C}$ cooled solution of tert-butyl (E)-(2-benzylidene-1-((triisopropylsilyl) ethynyl)hydrazine-1-carbonyl)-L-prolinate (4a) ( $199 \mathrm{mg}, 0.400 \mathrm{mmol}, 1.00$ equiv) in THF ( 4.00 mL ) was added TBAF ( 1 M in THF, $800 \mu \mathrm{~L}, 0.800 \mathrm{mmol}, 2.00$ equiv) dropwise, and the reaction was stirred for 30 min . The solution was warmed to ambient temperature, poured into $\mathrm{H}_{2} \mathrm{O}$ $(20 \mathrm{~mL})$, and extracted with EtOAc ( $3 \times 30 \mathrm{~mL}$ ). The organic extracts were combined, washed with brine ( 50 mL ), dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered, and concentrated under reduced pressure. The product was pure enough to be used in the next step without further purification. ${ }^{16}$

Following a reported procedure, ${ }^{17}$ to a solution of tert-butyl (E)-(2-benzylidene-1-ethynylhydrazine-1-carbonyl)-L-prolinate ( $\mathbf{2 1}$ ) ( $137 \mathrm{mg}, 0.400 \mathrm{mmol}, 1.00$ equiv), benzyl azide ( $50.0 \mu \mathrm{~L}, 0.400 \mathrm{mmol}, 1.00$ equiv), triethylamine ( $67.0 \mu \mathrm{~L}, 0.480 \mathrm{mmol}, 1.20$ equiv) in EtOH $(0.48 \mathrm{~mL})$ and $\mathrm{H}_{2} \mathrm{O}(0.48 \mathrm{~mL}), \mathrm{CuSO}_{4} \cdot 5 \mathrm{H}_{2} \mathrm{O}(30.0 \mathrm{mg}, 0.120 \mathrm{mmol}, 0.300$ equiv) and sodium L ascorbate ( $40.0 \mathrm{mg}, 0.200 \mathrm{mmol}, 0.500$ equiv) were added. The mixture was allowed to stir at rt for 2 h under $\mathrm{N}_{2}$ and concentrated. Then the mixture was diluted with water and extracted with ethyl acetate ( $3 \times 30 \mathrm{~mL}$ ). The organic layer was dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered and concentrated at reduced pressure. tert-Butyl (E)-(1-(1-benzyl-1H-1,2,3-triazol-4-yl)-2-benzylidenehydrazine-1-carbonyl)-L-prolinate (8) ( $145 \mathrm{mg}, 0.306 \mathrm{mmol}, 76 \%$ yield) was isolated as a brownish amorphous solid after purification by column chromatography on silica (DCM/MeOH 100:1).

Rf (Pentane/DCM 50:1): 0.19. ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.66(\mathrm{~s}, 1 \mathrm{H}), 7.61-7.48(\mathrm{~m}, 3 \mathrm{H}), 7.44-$ $7.28(\mathrm{~m}, 8 \mathrm{H}), 5.56(\mathrm{~s}, 2 \mathrm{H}), 5.29-4.26(\mathrm{br} \mathrm{s}, 1 \mathrm{H}), 4.15-3.52(\mathrm{br} \mathrm{s}, 2 \mathrm{H}), 2.46-2.18(\mathrm{br} \mathrm{s}, 1 \mathrm{H}), 2.07-$ 1.79 (br s, 3H), 1.52-1.19 (br s, 9H). ${ }^{13} \mathrm{C}$ NMR ${ }^{13} \mathrm{C}$ NMR ( $101 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 171.9,141.6,141.4$, 134.6, 134.2, 129.6, 129.4, 129.1, 128.7, 128.4, 127.4, 122.0, 81.2, 62.2, 55.1, 50.6, 28.0 (3 C were not fully resolved). ### 5.4 Hydrazone deprotection

A capped oven dried microwave vial charged with tert-Butyl (E)-(1-(1-benzyl-1H-1,2,3-triazol-4-yl)-2-benzylidenehydrazine-1-carbonyl)-L-prolinate (8) ( $47.5 \mathrm{mg}, 0.100 \mathrm{mmol}, 1.0$ equiv.) was evacuated and backfilled with $\mathrm{N}_{2}(3 x)$. Then, a pre-stirred solution of $\mathrm{NH}_{2} \mathrm{OH} \cdot \mathrm{HCl}(34.7$ $\mathrm{mg}, 0.500 \mathrm{mmol}, 5.0$ equiv.) in dry pyridine ( 0.3 mL ) was added under $\mathrm{N}_{2}$. The reaction was stirred at $60^{\circ} \mathrm{C}$ for 6 h , then, a freshly prepared solution of $\mathrm{NH}_{2} \mathrm{OH} \cdot \mathrm{HCl}(34.7 \mathrm{mg}, 0.500 \mathrm{mmol}$,

[^8]5.0 equiv.) in dry pyridine ( 0.3 mL ) was added under $\mathrm{N}_{2}$. The reaction was further stirred at $60^{\circ} \mathrm{C}$ for 16 h . The volatiles were evaporated in vacuo and the crude oil was co-evaporated with ethyl acetate to help removing pyridine. The crude compound was purified by preparative RP-HPLC ( $t_{R}$ : 11.5 min ) to afford tert-butyl (1-(1-benzyl-1H-1,2,3-triazol-4-yl)hydrazine-1-carbonyl)-L-prolinate trifluoroacetic acid salt (9) ( $16.0 \mathrm{mg}, 32.0 \mu \mathrm{~mol}, 32 \%$ ) as a white amorphous solid.
${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.85(\mathrm{~s}, 1 \mathrm{H}), 7.39-7.32(\mathrm{~m}, 3 \mathrm{H}), 7.31-7.26(\mathrm{~m}, 2 \mathrm{H}), 5.46(\mathrm{~s}, 2 \mathrm{H})$, $5.16(\mathrm{~s}, 3 \mathrm{H}), 4.63-4.55(\mathrm{~m}, 1 \mathrm{H}), 3.62(\mathrm{t}, \mathrm{J}=6.7 \mathrm{~Hz}, 2 \mathrm{H}), 2.23-2.12(\mathrm{~m}, 1 \mathrm{H}), 2.00-1.78(\mathrm{~m}$, $3 \mathrm{H}), 1.43(\mathrm{~s}, 9 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $\left.101 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)^{18} \delta 172.7,159.5(\mathrm{q}, \mathrm{J}=41.1 \mathrm{~Hz}), 156.5,149.5$, 134.3, 129.2, 129.0, 128.3, 114.2, 81.3, 62.2, 55.1, 49.8, 30.8, 28.1, 23.5.
